Doctor Web

Doctor Web develops and distributes Dr.Web® information security solutions which provide efficient protection from malicious software and spam.

Doctor Web customers can be found among home users from all over the world and in government enterprises, small companies and nationwide corporations.

Dr.Web antivirus solutions are well known since 1992 for continuing excellence in malware detection and compliance with international information security standards. State certificates and awards received by the Dr.Web solutions, as well as the globally widespread use of our products are the best evidence of exceptional trust to the company products.

We thank all our customers for their support and devotion to the Dr.Web products!

Document Conventions

The following conventions and symbols are used in this manual:

Convention	Description
Bold	Names of buttons and other elements of the graphical user interface (GUI), and required user input that must be entered exactly as given in the guide.
Green and bold	Names of Dr.Web products and components.
<u>Green and underlined</u>	Hyperlinks to topics and webpages.
Monospace	Code examples, input to the command line and application output.
<i>Italic</i>	Placeholders which represent information that must be supplied by the user. For command-line input, it indicates parameter values. In addition, it may indicate a term in position of a definition.
CAPITAL LETTERS	Names of keys and key sequences.
Plus sign ('+')	Indicates a combination of keys. For example, ALT+F1 means to hold down the ALT key while pressing the F1 key.
	A warning about potential errors or any other important comment.

Introduction

Thank you for purchasing **Dr.Web® Anti-virus for Linux** (**Dr.Web for Linux** or **Anti-virus** hereinafter). It offers reliable protection from various types of [computer threats](#) using the most advanced virus detection and neutralization [technologies](#).

This manual is intended to help users of computers running under OS **GNU/Linux** family (**Linux** hereinafter) install and use **Dr.Web for Linux** 10.0.0.

If **Dr.Web for Linux** 6.0.2 or 9.0 is already installed on your computer and you wish to upgrade **Anti-virus** to version 10.0.0, do the steps of the [upgrade procedure](#).

About this Product

Dr.Web for Linux is an anti-virus solution designed to protect computers running under OS **GNU/Linux** family from viruses and threats of other types.

The core components of the program (anti-virus engine **Dr.Web Virus-Finding Engine** and **Dr.Web** virus databases) are not only extremely effective and resource-sparing, but also cross-platform, which allows **Dr.Web** specialists to create outstanding anti-virus solutions for different operating systems.

Components of **Dr.Web for Linux** are constantly updated and virus databases are supplemented with new signatures to ensure up-to-date protection. Moreover, heuristic analysis methods are used for providing additional protection against unknown viruses.

Main Functions

Dr.Web for Linux provides you with the following features:

1. **Detection and neutralization** of malicious programs (for example, viruses, including those that infect mailboxes and boot records, Trojans, mail worms) and unwanted software (for example, adware, joke programs, dialers).

Dr.Web for Linux uses several malware detection methods simultaneously:

- *signature analysis*, which allows detection of known threats
- *heuristic analysis*, which allows detection of threats that are not present in virus databases

Note that as with any system of hypothesis testing under uncertainty, the *heuristics analyzer* may omit viruses or raise false alarms. As an object can be erroneously considered malicious, all threats detected by the *heuristics analyzer* are treated as suspicious. So, it is recommended not to delete such threats but move them to quarantine and send to **Doctor Web** virus laboratory for analysis. For details on methods used to neutralize computer threats, refer to [Fighting computer Threats](#) (Appendix B).

System objects are scanned at user request or automatically, according to the scheduled. The user can launch scanning of all file system objects (including both files and boot records) as well as select custom scan when only specified files, directories, and boot records are scanned. Also it is possible to scan only binary executable files containing code of currently running processes. If a threat is detected in such case, not only the malicious object is neutralized but also the active process is terminated.

2. **Monitoring access to data files and attempts to run executables.** This feature allows detection and neutralization of malware right at the moment of an infection attempt.
3. **Monitoring access to the Internet.** This feature allows to control attempts to access Internet servers and, if required, block those websites that are added to black lists. Files downloaded from the Internet are checked "on the fly" for viruses and other threats. To restrict access to unwanted websites, **Dr.Web for Linux** uses subject black lists (delivered with **Anti-virus** and updated automatically) and user black and white lists (configured by the user).
4. **Reliable isolation of infected or suspicious objects.** Such objects are moved to a special storage, quarantine, to prevent any harm to the system. When moving to quarantine, objects are renamed according to special rules and, if necessary, they can be restored to their original location only at user request.
5. **Automatic update** of **Dr.Web** virus databases and engine to enable **Anti-virus** to use the most recent information about known malicious software.
6. **Operation in central protection mode** (when connected to the central protection server, such as **Dr.Web Enterprise Server** or as a part of **Dr.Web AV-Desk** service). This mode allows implementation of a unified security policy on computers within the protected network. It can be a corporate network, a private network (VPN), or a network of a service provider (for example, a

provider of Internet service).

System Requirements

You can use **Dr.Web for Linux Anti-virus** on a computer that meets the following requirements:

Specification	Requirement
Platform	Both 32-bit (IA-32 , x86) and 64-bit (x86-64 , x64 , amd64) Intel platforms are supported.
Hard disk space	Minimum 512 MB of free disk space on a volume where the Anti-virus directories are located.
OS	Linux for Intel x86/amd64 platform based on kernel ver. 2.6.37 or later, and using library glibc ver. 2.13 or later. Tested Linux distributions are listed below. On systems operating on 64-bit platforms, support of 32-bit applications must be enabled (probably, additional libraries must be installed for this, see below).
Other	The following valid network connections: Valid Internet connection to enable updates for virus databases and Dr.Web for Linux components. When operating in central protection mode, connection to the server on the network is enough; connection to the Internet is not required.

The product was tested on the following **Linux** distributions (32-bit and 64-bit):

Linux distribution name	Version	Required additional libraries for 64-bit OS version
Debian	7	libc6-i386
Fedora	20	glibc.i686
Mint	16, 17	libc6-i386
Ubuntu	12.04 LTS, 13.04, 13.10, 14.04	libc6-i386
CentOS	5.10, 6.5, 7 (64-bit only)	glibc.i686
Red Hat Enterprise Linux	5.10, 6.5, 7 (64-bit only)	glibc.i686

Other **Linux** distributions that meet the above-mentioned requirements have not been tested for compatibility with **Anti-virus** but may be supported. If a compatibility issue occurs, contact technical support on the official website at <http://support.drweb.com/request/>.

On **Debian**, **Fedora**, **Mint**, and **Ubuntu**, **SpIDer Guard** (see below) uses the **fanotify** monitoring interface by default. On **CentOS** and **Red Hat Enterprise Linux**, the component uses a special loadable kernel module, which is supplied completely assembled with the product.

If necessary, you can [build a loadable module](#) manually by using the supplied source codes for any **GNU/Linux**-based operating systems with kernel 2.6.x and newer.

Additional Packages

- To enable **Anti-virus** operation in graphics mode and startup of the program for product installation and removal in graphics mode, **X Window System** graphics subsystem and any window manager is required. Moreover, for correct operation of the indicator for **Ubuntu Unity** desktop environment,

the `libappindicator1` library is also required.

- For scheduled scanning, `crond` must be installed in the operating system.
- To start the product installer or uninstaller, designed for the command line, in graphics mode, a terminal emulator (such as `xterm`, `xvt`, etc.) is required. To enable privileges elevation during installation or uninstallation, one of the following utilities is required: `su`, `sudo`, `gksu`, `gksudo`, `kdesu`, `kdesudo`, `beesu`, `beesudo`.

For convenient work with **Anti-virus** in the command line, you can enable command auto-completion in the used command shell (if disabled).

If you encounter any problem with installation of additional packages and components, refer to User Manuals for the used distribution of the operating system.

Program Structure

Dr.Web for Linux consists of the following components:

Component	Description
Scanner	Scans file system objects (files, directories, and boot records) for threats. Scanning can be started at user request or as scheduled. The user can start scanning from both graphics and command-line modes.
SpIDer Guard file system monitor	Operates in resident mode and controls file system operations (such as creation, opening, and closing a file). Sends Scanner requests to check contents of new or modified files and contents of executables when they are attempted to run.
SpIDer Gate Internet access monitor	Component operating in resident mode and controlling all attempts to access web resources. Checks whether requested URLs are in the used black lists and, if so, blocks access to the corresponding resources. Sends Scanner requests to scan files downloaded from the Internet (from allowed web servers).
Anti-virus engine	Central component of anti-virus protection used by Scanner for searching and detecting of threats as well as for analysis of suspicious object behavior.
Virus databases	Automatically updated database used by the anti-virus engine and containing information for detection and neutralization of known threats.
Updater	Downloads updates to the virus databases and anti-virus engine from Doctor Web update servers automatically, according to the schedule or at user request.
License manager	Helps users manage their licenses and do the following: activate a license and demo period, view information on the current license, renew the license, as well as install or remove a license key file.

Apart from the components described in the table, **Dr.Web for Linux** includes service components that operate in background mode and do not require user intervention.

SpIDer Guard, the file system monitor, can operate in one of the following modes:

- **FANOTIFY** – using the `fanotify` monitoring interface (not all **GNU/Linux**-based OS support `fanotify`)
- **LKM** – using the loadable **Linux** kernel module (compatible with any **GNU/Linux**-based OS with kernel 2.6.x and newer)

By default, the file system monitor automatically chooses the appropriate operation mode according to the environment. If **SpIDer Guard** cannot be started, [build and install](#) a loadable kernel module by using the supplied source codes.

Quarantine Directories

Quarantine directories serve for isolation of files that pose a threat to system security and cannot be currently cured. Such threats are those that are unknown to **Anti-virus** (that is, a virus is detected by the *heuristic analyzer* but the virus signature and method to cure are absent in the databases) or those that caused an error during scanning. Moreover, a file can be quarantined at user request if the user selected this [action](#) in the list of detected threats or specified this action in **Scanner** or **SpIDer Guard** settings as reaction to this threat [type](#).

When a file is quarantined, it is renamed according to special rules. Renaming of isolated files prevents users and applications from accessing these files in case of bypassing quarantine management tools implemented in **Dr.Web for Linux**.

Quarantine directories are located in

- **User home directory** (if multiple user accounts exist on the computer, a separate quarantine directory can be created for each of the users)
- **Root directory** of each logical volume mounted to the file system

Dr.Web quarantine directories are always named as `.com.drweb.quarantine` and are not created until the **Quarantine (Isolate) action** is applied. At that, only a directory required for isolation of a concrete object is created. When selecting a directory, the file owner name is used: search is performed upwards from the location where the malicious object resides and if the owner home directory is reached, the quarantine storage created in this directory is selected. Otherwise, the file is isolated in the quarantine created in the root directory of the volume (which is not always the same as the file system root directory). Thus, any infected file moved to quarantine always resides on the volume, which provides for correct operation of quarantine in case several removable data storages and other volumes are mounted to different locations in the system.

Users can manage objects in quarantine both in [graphics](#) mode and from the [command line](#). Every action is applied to the consolidated quarantine; that is, changes affect all quarantine directories available at the moment. From the viewpoint of the user, the quarantine directory located in the user home directory is considered *User quarantine* and other directories are considered *System quarantine*.

Operation with quarantined objects is allowed even if no [active license](#) is found. However, isolated objects cannot be cured in this case.

Files Permissions and Privileges

To scan objects of the file system and neutralize threats, **Dr.Web for Linux** (or rather the user under whom **Anti-virus** runs) requires the following permissions:

Action	Required permissions
Listing all detected threats	Unrestricted. No special permission required.
List archive contents (only corrupted or malicious elements)	Unrestricted. No special permission required.
Moving to quarantine	Unrestricted. A user can quarantine all infected files regardless of read or write permissions on them.
Removing a threat	User must have write permission on the deleted file.
Curing	Unrestricted. The permissions and owner of a cured file remain the same. If deletion is applied to the file while curing, it is removed from the system regardless of the permissions that the user has on the file.

Action	Required permissions
Restoring a file from quarantine	User must have permissions to read the file and to write to the restore directory.
Deleting a file from quarantine	User must have write permissions to the file that was moved to quarantine.

To temporarily elevate **Dr.Web for Linux** privileges in graphics mode, click the [corresponding button](#) in the **Anti-virus** window. To enable operation of the **Anti-virus** in [graphics mode](#) or of the command-line management [tool](#) with superuser privileges, you can use the **su** command, which allows to change the user, or the **sudo** command, which allows to execute a command as another user.

Note that **Scanner** cannot check file which size exceeds 4 Gbytes (on attempt to scan such files, the following error message displays: "File too large").

Operation Modes

Dr.Web for Linux can operate both in Standalone mode and as a part of an anti-virus network managed by a central protection server. Operation in Central protection mode does not require installation of additional software or **Dr.Web for Linux** reinstallation or removal.

- **In Standalone mode**, the protected computer is not connected to an anti-virus network and its operation is managed locally. In this mode, configuration and license key files reside on local disks and **Dr.Web for Linux** is fully controlled from the protected computer. Updates to virus databases are received from **Doctor Web** update servers.
- **In Central Protection mode**, protection of the computer is managed by the central protection server. In this mode, some functions and settings of **Dr.Web for Linux** can be adjusted in accordance with the general (corporate) anti-virus protection policy implemented on the anti-virus network. The license [key file](#) used for operating in Central protection mode is received from the central protection server. The key file stored on the local computer, if any, is not used. Statistics on virus events is sent to the central protection server. Updates to virus databases are also received from the central protection server.
- **In Mobile mode**, **Dr.Web for Linux** receives updates from **Doctor Web** update servers, but operation of **Anti-virus** is managed with the local settings. The used key file is received from the central protection server.

When **Anti-virus** is operating in Central protection or Mobile mode, the following options are blocked:

1. Deletion of a license key file in **License Manager**
2. Manual start of an update process and adjustment of update settings
3. Configuration of file system scanning parameters

Configuration of **SpIDer Guard** settings as well as an option to enable or disable **SpIDer Guard** checks are allowed in dependence on permissions specified on the server.

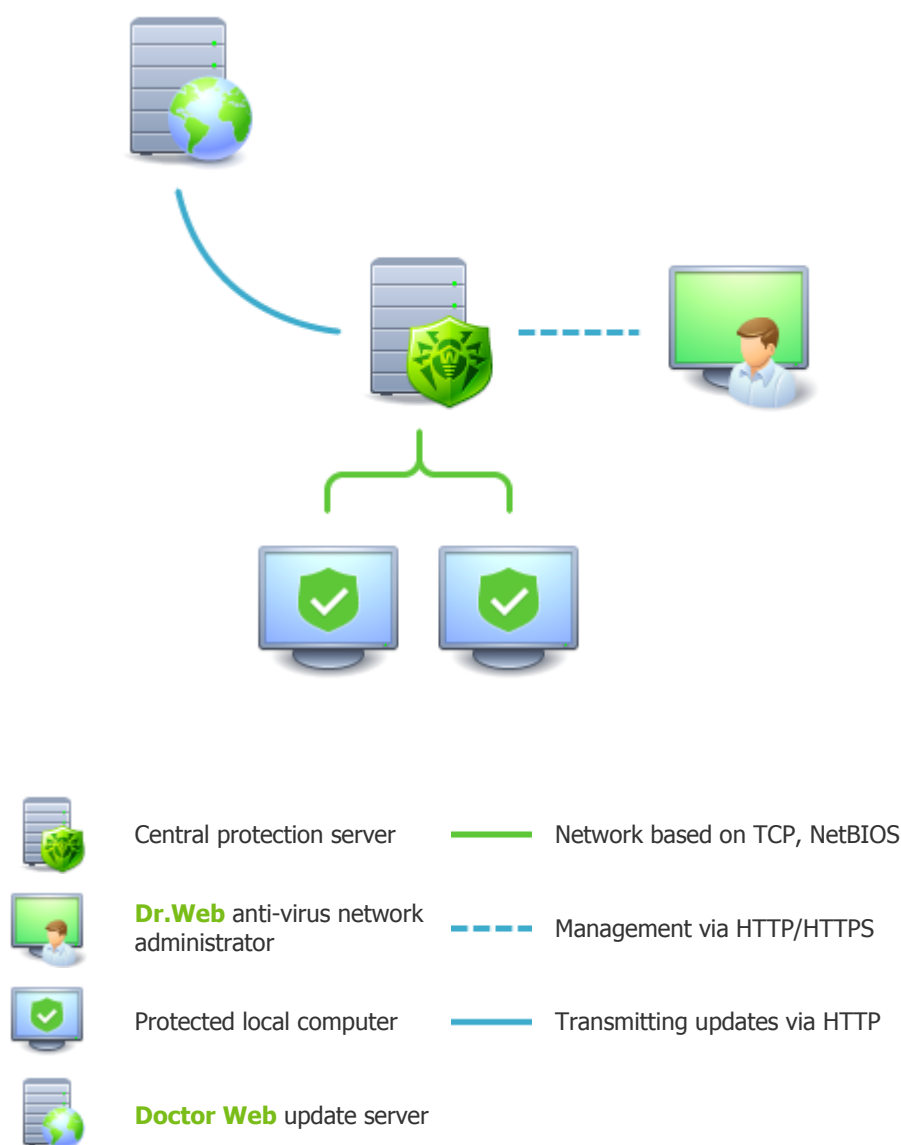

Note that if launch of scanning at user request is prohibited on the used central protection server, the [Scan](#) page of the **Anti-virus** window will be disabled. Moreover, in this case **Scheduler** will not launch scans even if they are [scheduled](#).

Logical Structure of Anti-Virus Networks

Doctor Web solutions for central protection use client-server model (see the picture below).

Workstations and servers are protected by *local anti-virus components* (herein, **Dr.Web for Linux**) installed on them, which provides for anti-virus protection of remote computers and allows connection between the workstations and the central protection server.

Picture 1. Logical structure of the Anti-Virus Network

Local computers are updated and configured from the *central protection server*. The stream of instructions, data and statistics in the anti-virus network goes also through the central protection server. The volume of traffic between protected computers and the central server can be quite sizeable, therefore solutions provide options for traffic compression. To prevent leak of sensitive data or substitution of software downloaded onto protected computers, encryption is also supported.

All necessary updates are downloaded to the central protection server from **Doctor Web** update servers.

Local anti-virus components are configured and managed from the central protection server according to commands from anti-virus network administrators. Administrators manage central protection servers and topology of anti-virus networks (for example, validate connections to the central protection server from remote computers) and configure operation of local anti-virus components when necessary.

Local anti-virus components are not compatible with anti-virus products of other companies or anti-virus solutions of **Dr.Web** if the latter do not support operation in Central protection mode (for example, version 5.0 of **Dr.Web for Linux**). Installation of two anti-virus programs on the same computer can cause a system crash and loss of important data.

Connecting to Anti-Virus Network

Dr.Web for Linux can be connected to an anti-virus network in one of the following ways:

- During **Dr.Web for Linux** [activation](#) – in the [License Manager](#)
- On the **Mode** [tab](#) of the [settings window](#) in the **Dr.Web for Linux** graphical interface
- Using the `esconnect` [command](#) of the command-line management tool – `drweb-ctl`

Disconnecting from Anti-Virus Network

Dr.Web for Linux can be disconnected from the anti-virus network in one of the following ways:

- On the **Mode** [tab](#) of the [settings window](#) in the **Dr.Web for Linux** graphical interface
- Using the `esdisconnect` [command](#) of the command-line management tool – `drweb-ctl`

Testing Anti-virus Operation

The `EICAR` (*European Institute for Computer Anti-Virus Research*) Test helps testing performance of anti-virus programs that detect viruses using signatures. This test was designed specially so that users could test reaction of newly-installed anti-virus tools to detection of viruses without compromising security of their computers.

Although the `EICAR` test is not actually a virus, it is treated by the majority of anti-viruses as if it were a virus. On detection of this "virus", **Dr.Web** anti-virus products report the following: **EICAR Test File (Not a Virus!)**. Other anti-virus tools alert users in a similar way. The `EICAR` test file is a 68-byte COM-file for MS DOS/MS Windows OS that outputs the following line on the console when executed:

```
EICAR-STANDARD-ANTIVIRUS-TEST-FILE!
```

The `EICAR` test contains the following character string only:

```
X5O!P%@AP[4\PZX54(P^)7CC)7}$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*
```

To create your own test file with the "virus", you may create a new file with the line mentioned above.

If **Dr.Web for Linux** operates correctly, the `EICAR` test file is detected during a file system scan regardless of the scan type and the user is notified on the detected threat: **EICAR Test File (Not a Virus!)**.

Licensing

Permissions to use **Dr.Web for Linux** are granted by the *license* purchased from **Doctor Web** company or from **Doctor Web** partners. License parameters determining user rights are set in accordance with the **License agreement** which the user accepts during product installation. The license agreement contains information on the user and the vendor as well as usage parameters of the purchased product, including:

- List of components licensed to the user
- License period
- Other restrictions (for example, number of computers on which the purchased **Anti-virus** is allowed for use).

For evaluation purposes users may also activate *demo period*. After successful activation, demo period provides users with full functionality of the solution for the whole activated period.

Each **Doctor Web** product license has a unique serial number associated with a special file stored on the user computer. This file regulates operation of **Anti-virus** components in accordance with the license parameters and is called a *license key file*. Upon activation of a demo period, a special key file, named a *demo key file*, is automatically generated.

If a license or a demo period are not activated on the computer, **Anti-virus** components are blocked. Moreover, updates to virus databases cannot be downloaded from **Doctor Web** update servers. But you can activate **Anti-virus** by connecting it to the central protection server as a part of the [anti-virus network](#) administered by the enterprise or Internet service provider. In this case, operation of **Anti-virus** and updating are managed by the central protection server.

Purchasing and Registering Licenses

After a license is purchased, updates to product components and virus databases are regularly downloaded from **Doctor Web** update servers. Moreover, if the customer encountered any issue when installing or using the purchased product, they can take advantage of technical support service provided by **Doctor Web** or **Doctor Web** partners.

You can purchase any **Dr.Web** product as well as obtain a product serial number either on the [online store](#) or from our [partners](#). For details on license periods and license types, visit the **Doctor Web** official website at <http://www.drweb.com/>.

License registration is required to prove that you are a legal user of **Dr.Web for Linux** and activate **Anti-virus** functions including virus database updating. It is recommended to register the product and activate the license once installation completes. A purchased license can be activated in one of the following ways:

- via the [Registration Wizard](#) included in **License Manager**.
- on the **Doctor Web** official website at <http://products.drweb.com/register/>.

During activation, it is required to enter the serial number of the purchased license. The serial number is supplied with the product or via email when purchasing or renewing the license online.

If you have used **Dr.Web for Linux** in the past, you may be eligible for a 150-day extension to your new license. To enable the bonus, enter your registered serial number or provide the license key file. Otherwise, if you select an option to renew the license but do not provide the previous license data, the period of license validity will be reduced by 150 days.

If you have several licenses for using **Anti-virus** on several computers, but choose to use the product only on one computer, you can specify this and, hence, license validity period will be automatically extended.

Obtaining Demo License

Users of **Dr.Web** can obtain a demo period for

- 3 months
- 1 month

To obtain a demo period for 3 months, register on the **Doctor Web** official website and provide the requested personal data. After registration completes, you will receive an email with a serial number for **Anti-virus** activation. Demo period for 1 month can be received in the Registration wizard window of **License Manager**. To obtain a demo period for 1 month, you do not need to provide your personal data.

You can start registration or obtain a demo period from the **License Manager** window at any time by clicking the **Activate License** button on the [page](#) with information on the current license.

To activate a license using the serial number or request a demo license, a valid Internet connection is required.

Another demo period for the same computer can be obtained after a certain time period.

When a demo period or license is activated via **License Manager**, the key file (license or demo) is automatically generated on the local computer in its target directory. If you register on the website, the key file is sent by email and you need to [install](#) the key file manually.

Subsequent Registration

If a key file is lost but the existing license is not expired, you must register again by inputting the personal data you provided during the previous registration. You may use a different email address. In this case, the key file will be sent to the newly specified address.

The number of times you can request a key file is limited. One serial number can be registered no more than 25 times. If requests in excess of that number are sent, no key file will be delivered. To receive a lost key file, contact [technical support](#), describe your problem in detail, and state personal data you entered upon serial number registration. The license key file will be sent by email.

Key File

Key file is a special file stored on the local computer. It corresponds to the purchased license or activated demo period for **Dr.Web for Linux**. The file contains information on the provided license or demo period and regulates usage rights in accordance with it.

The key file has `.key` extension and is valid if satisfies the following criteria:

- License or demo period is not expired
- Demo period or license applies to all anti-virus components required by the product
- Integrity of the key file is not violated

If any of the conditions are violated, the license key file becomes invalid.

During **Dr.Web for Linux** operation, the key file must reside in the default `/etc/opt/drweb.com` directory and have the `drweb32.key` name.

Components of **Anti-virus** regularly check whether the key file is available and valid. The key file is digitally signed to prevent its editing. So, the edited key file becomes invalid. It is not recommended to open your key file in text editors in order to avoid its accidental invalidation.

If no valid key file (license or demo) is found, or if the license is expired, operation of the anti-virus components is blocked until a valid key file is installed.

It is recommended to keep the license key file until it expires, and use it to reinstall **Dr.Web for Linux** or install it on a different computer. In this case, you must use the same product serial number and customer data that you provided during the registration.

Key File Installation

If you have a key file corresponding to the valid license for the product (for example, if you obtained the key file by email or if you want to use **Dr.Web for Linux** on another computer), you can activate **Anti-virus** by specifying the path to the key file.

You can specify the key file path

- in the **License Manager** by clicking **Other activation types** on the first step of the registration procedure and specifying the key file path.
- manually. For that purpose
 1. Unpack the key file if archived
 2. Copy the file to the `/etc/opt/drweb.com` directory and rename it to `drweb32.key`

You can also use the following **command**:

```
$ drweb-ctl cfset Root.KeyPath </path/to/key/file>
```

In this case, the key file will not be copied to the `/etc/opt/drweb.com` directory and will remain in its original location. If so, the user becomes responsible for ensuring that the file is protected from corruption or deletion. This installation method is not recommended as the key file can be accidentally deleted from the system (for example, if the directory, where the key file resides, is periodically cleaned up).

Connection Settings File

The connection settings file is a special file that stores parameters that configure connection between **Dr.Web for Linux** and the [central protection](#) server.

This file is supplied by the administrator of the Anti-virus network or the Internet service provider (if the latter provides support for the central anti-virus protection service).

You can use this file to activate **Dr.Web for Linux** when connecting it to the central protection server (in this case, you cannot use **Anti-virus** in Standalone mode without purchasing additional [license](#)).

Activation via connection to central protection server

If the Internet service provider or network administrator submitted a file with settings of connection to the central protection server, you can activate **Anti-virus** by specifying the file path.

To specify a path to the connection settings file

1. Open [License Manager](#) and start the registration procedure by clicking the **Activate license** button.
2. Select **Other activation types**.
3. Specify the file path in the displayed box.

Installing and Removing Dr.Web for Linux

This section describes how to install, update, and remove **Dr.Web for Linux** 10.0.0. Also in this chapter you can find the procedure of updating to a new version, if **Dr.Web for Linux** 6.0.2 or 9.0 is already installed on your computer.

These procedures can be performed only by a user with administrative privileges (`root` superuser). To elevate privileges, use the `su` command (change the current user) or the `sudo` command (execute the specified command with other user privileges).

Upgrading to Newer Version

Introductory remarks

Please note that your version of **Anti-virus** should be upgraded the same way as it was used during the installation:

- If the current version was installed from the repository, an upgrade requires updating program packages from the repository.
- If the current version was installed from the distribution, an upgrade requires installation of another distribution of the new version.

To identify how the product version was installed, check whether the **Anti-virus** executable directory (either `/opt/drweb` or `/opt/drweb.com/bin`, depending on the product version) contains `remove.sh` [delete script](#). If so, the current version was installed from the universal package; otherwise, it was installed from the repository.

If you cannot update the product the way you installed it initially, remove your current version of **Dr.Web for Linux**, and then install a new version using any convenient method. Installation and removal procedures for previous **Dr.Web for Linux** versions are the same as [installation](#) and [removal](#) described in the current manual for version 10.0.0. For additional information, see User manual for your current version of **Dr.Web for Linux**.

Installing universal package for an upgrade

Install **Dr.Web for Linux** 10.0.0 from the [installation file](#). During the installation, you are prompted to automatically remove the older version installed from the distribution.

Upgrading from the repository

For updating of your current **Dr.Web for Linux** version, installed from the **Doctor Web** repository, in dependence of packages type, do the following:

- **In case of using RPM packages (yum):**

1. Remove all packages of the current version using the command

```
# yum remove drweb*
```

In certain operating systems, a '*' character must be escaped. In this case, specify `drweb*` instead of `drweb*`. This command will prompt you to remove **all** installed **Dr.Web** packages. Therefore it should be used carefully, if you have installed several **Dr.Web** products on your workstation.

2. Change the used repository (from the package repository of your current version to the package repository 10.0.0).

You can find the name of the repository in the [Installing from Dr.Web Repository](#) chapter. For details on how to change repositories, refer to help guides of the used operating system distribution.

3. Install the new **Dr.Web for Linux** version using the command

```
# yum install drweb-workstations
```

For an additional information, refer to chapters [Removing](#) and [Installing](#) product packages using the **Dr.Web** repository (to parts, corresponding to OS and packages manager which are used).

- **In case of using DEB packages (apt-get):**

1. Change the used repository (from the package repository of your current version to the package repository 10.0.0).
2. Update the product using the following commands:

```
# apt-get update
# apt-get dist-upgrade
```

Key file transfer

Regardless of the selected method to upgrade **Anti-virus**, the license [key file](#) is installed to the default location (the new version uses the key file either while operation of the [installation wizard](#) or on the first **Anti-virus** startup in [graphics mode](#)).

If any problem occurs during automatic installation of the key file, you can [install it manually](#).

The license key file of **Dr.Web for Linux** resides in one of the following directories (depending on the version):

- For version 6.0.2 – /home/<user>/.**drweb** (the directory is hidden)
- For version 9.0 – /etc/opt/**drweb.com**

If a valid license key file is lost, contact **Doctor Web** [technical support](#).

Dr.Web for Linux 10.0.0 does not support quarantine of **Dr.Web for Linux** 6.0.2! If any isolated files remain in quarantine of an older version, you can retrieve or delete these files manually. Quarantine of **Dr.Web for Linux** 6.0.2 isolates files into the following directories:

- /var/**drweb**/infected – system
- /home/<user>/.**drweb**/quarantine – user (where <user> is the name of the user).

To simplify processing of quarantined files, it is recommended to revise quarantine using **Dr.Web for Linux** 6.0.2 before starting an upgrade.

Note that if your current version of **Dr.Web for Linux** is active when upgrading the product, processes of the older version **remain running until the user logs off the system** after the upgrade is complete. At that, if **Anti-virus** is operating in graphics mode, the icon of the older version can display in the notification area.

Installation Procedure

To install **Dr.Web for Linux**, do one of the following:

- Download the installation file with the [universal package](#) for UNIX systems from the **Doctor Web** official website. The package is supplied with installers (both graphical and console) started

depending on the environment.

- Download the [native packages](#) from the corresponding package repository of **Doctor Web**.

Regardless of the selected way to install **Dr.Web for Linux**, after the installation completes, you need either to activate the license, or install the key file if obtained, or connect **Anti-virus** to the central protection server.

Until you do that, **anti-virus protection is disabled**.

Installing Universal Package

Dr.Web for Linux is distributed as an installation file named `drweb-workstations_<version>~linux_<platform>.run`, where `<version>` is a line that contains the version and data of product release, and `<platform>` is a platform for which the product is intended (`x86` for 32-bit platforms and `amd64` for 64-bit platforms). For example:

```
drweb-workstations_10.0.0.0-1409012000~linux_x86.run
```

Note that the installation file name corresponding to the above-mentioned format is referred to as `<file_name>.run`.

To install **Dr.Web for Linux** components

1. Download the archive from the official **Doctor Web** website.
2. Save the archive to the hard disk drive of the computer.
3. Allow the archive to execute, for example, using the following command:

```
# chmod +x <file_name>.run
```

4. Execute the archive using the following command:

```
# ./<file_name>.run
```

or use the standard file manager of the graphical shell for both changing file properties and running the file.

At that, a `<file_name>` directory with a set of files is created and installation procedure is automatically started. If not started with `root` privileges, the Installation Wizard attempts to elevate the privileges.

Depending on the environment where the distribution is started, one of the following installation programs runs:

- Installation Wizard for [graphics mode](#)
- Installer for [command-line mode](#)

At that, the installer for command-line mode is automatically started if the Installation Wizard for graphics mode fails to start.

5. Follow the prompts of the installer.

Note that if the used **Linux** distribution features **SELinux**, the installation process can be interrupted by the security subsystem. If such situation occurs, set **SELinux** to the (Permissive) mode. To do this, enter the following command:

```
# setenforce 0
```

and restart the installer.

After the installation completes, configure **SELinux** [security policies](#) to enable correct operation of the **Anti-virus** components.

After installation in the desktop graphical shell completes, the **Dr.Web** item displays on the application menu. This item contains two items:

- **Dr.Web for Linux** to run **Dr.Web for Linux** in [graphics mode](#)
- **Remove Dr.Web components** item to [delete](#) the components

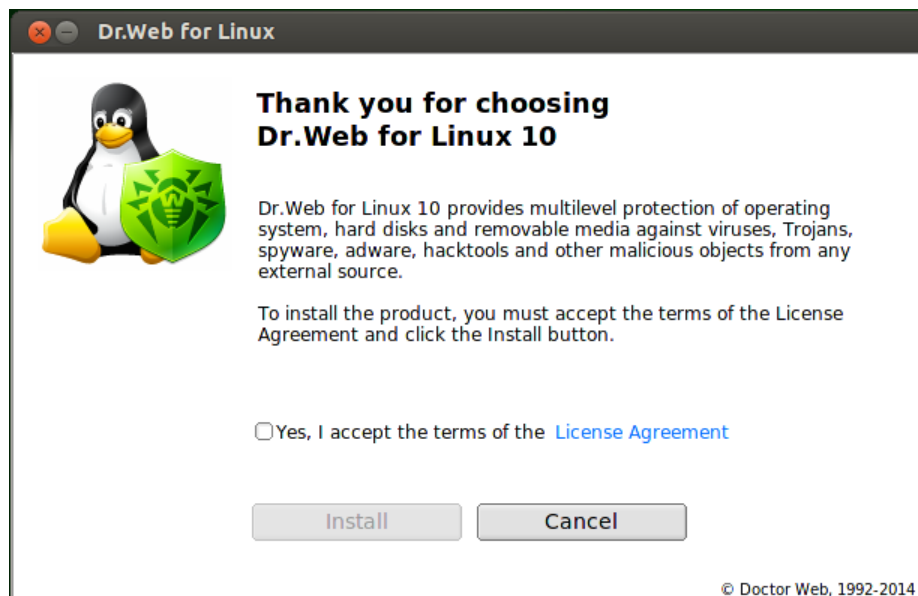

After successful installation you can remove the <file_name> directory with installation files.

If necessary, you can take advantage of the [custom installation](#) option (for example, to resolve errors that occurred in **Anti-virus** operation).

Installing in Graphics Mode

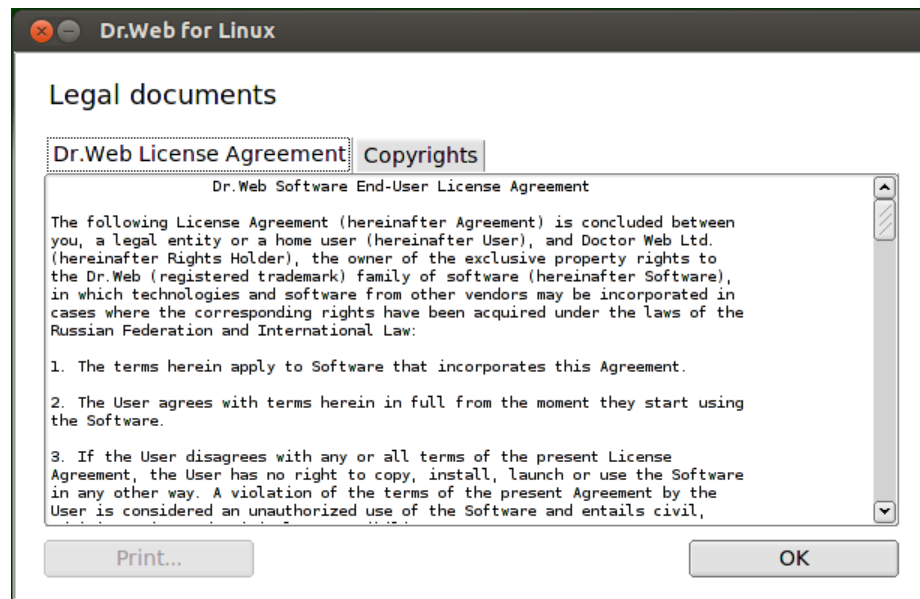

After the installation program for graphics mode starts, a window of the Installation Wizard displays.

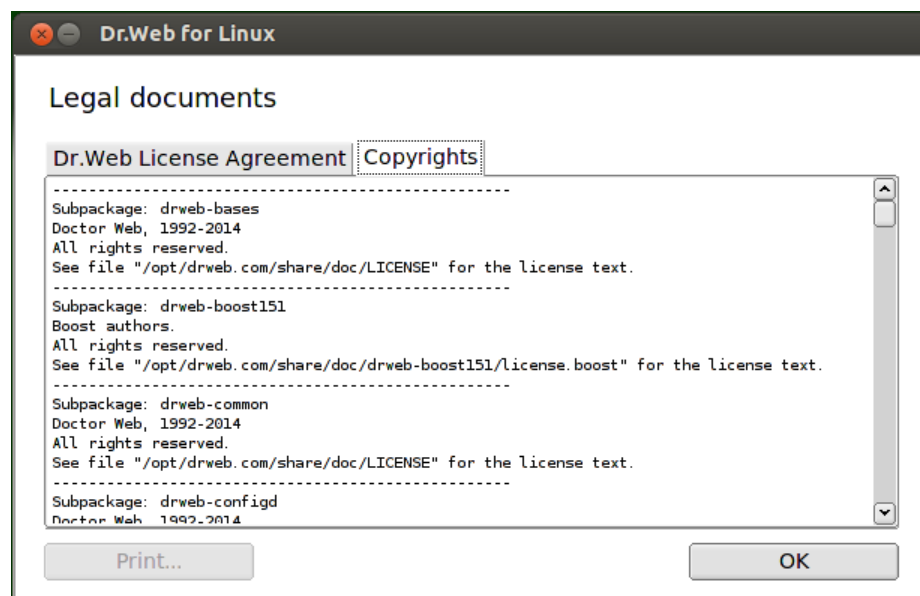

Picture 2. Welcome page

To install **Dr.Web for Linux** on your computer, do the following:

1. View the terms of the **Doctor Web License agreement**. For that purpose, click **Yes, I accept the terms of the License Agreement**. A page with the **License agreement** text and copyright information for the installed components opens.

Picture 3. License Agreement page

Picture 4. Copyright information page

When required, if a printer is installed and configured in your system, you can print off the **License agreement** terms and copyright information. To do that, open the corresponding tab of the **License agreement** page and click the **Print** button.

To close the page, click **OK**.

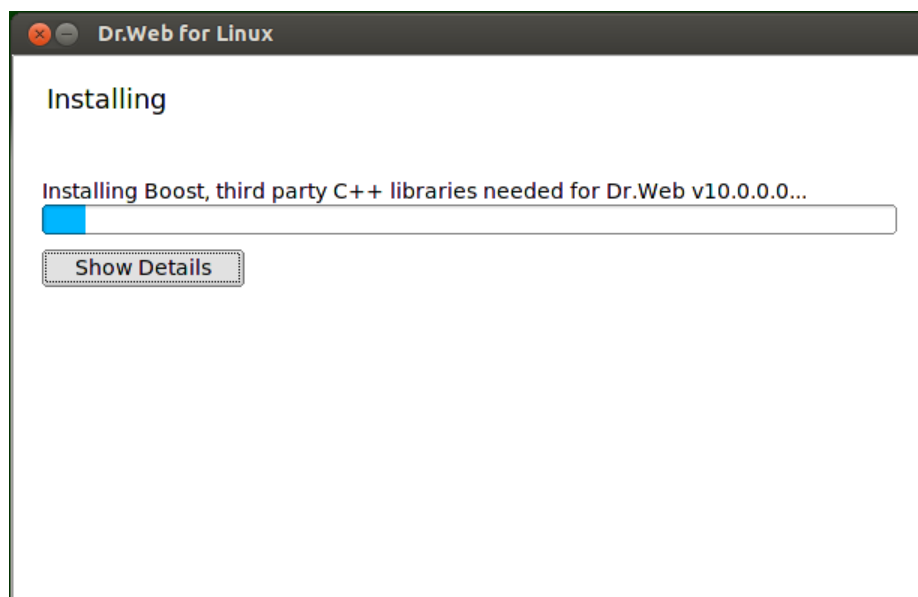

2. To start installation, accept the **Doctor Web License agreement** by selecting the **Yes, I accept the terms of the License Agreement** check box.

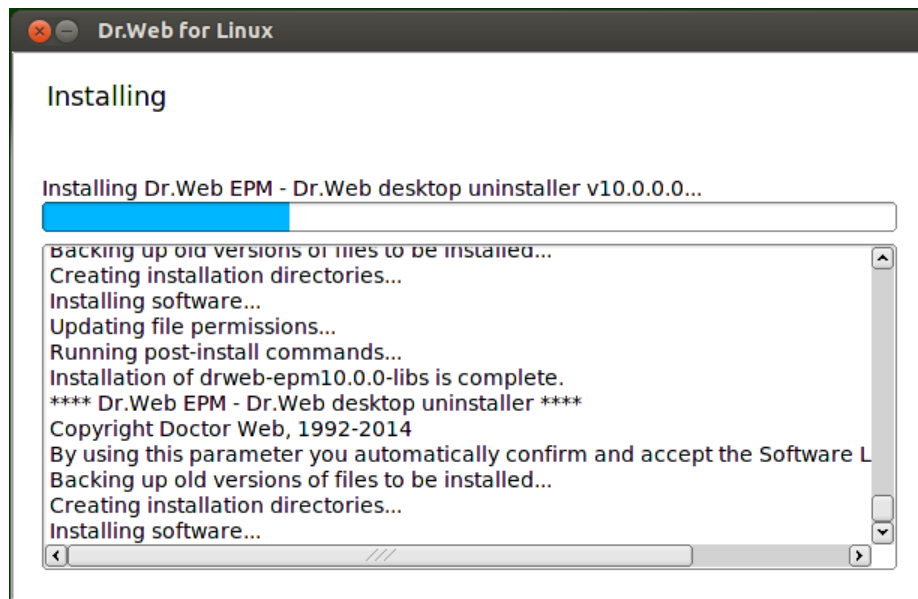

Picture 5. Confirmation of License agreement acceptance

If you choose not to install **Anti-virus** on your computer, click **Cancel**. Once the button is clicked, the Installation Wizard exits. If you choose to install the product, click **Install**.

3. After installation starts, a page with the progress bar opens. If necessary, you can click **Show Details** and view the installation log file.

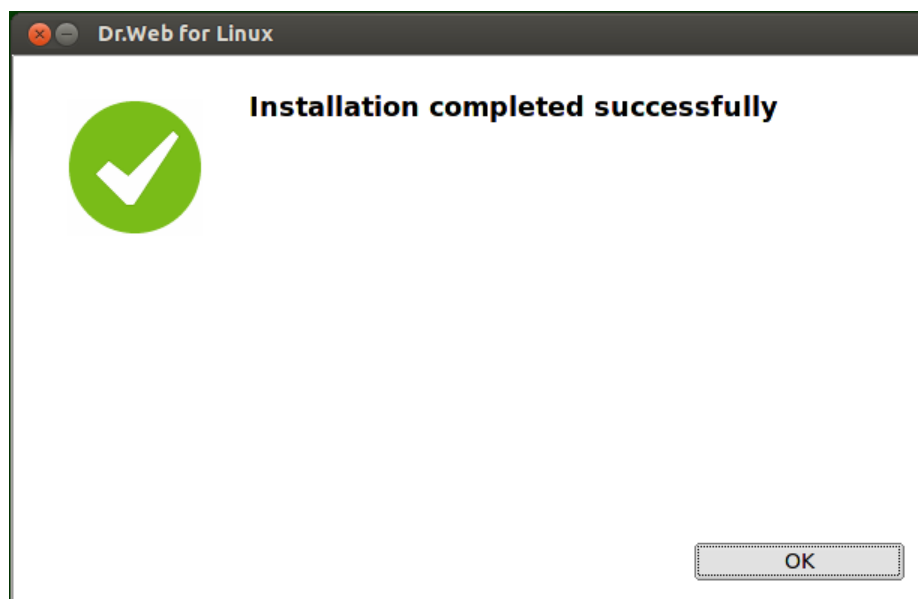

Picture 6. Installation progress bar

Picture 7. Viewing installation log file

4. After program files are successfully copied and all required adjustments to system files are made, the final page with the installation results displays.

Picture 8. Installation results page

5. To exit the Installation Wizard, click **OK**.

If the installation process fails due to an error, the final page of the Installation Wizard will contain the corresponding message. In this case, exit the Installation Wizard, remove the problems that caused this error and start an installation procedure again.

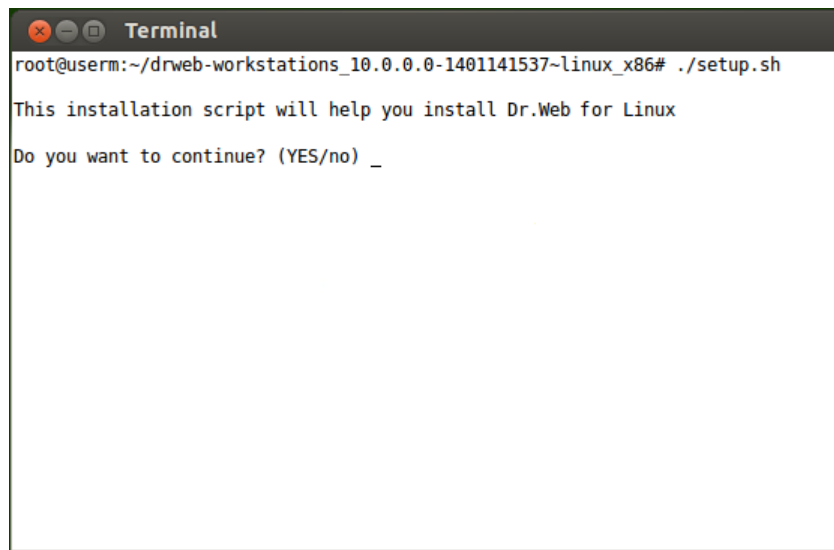

Installing from Command Line

Once the installation program for the command line starts, the command prompt displays on the screen.

1. To start installation enter **yes** or **y** in response to the "Do you want to continue?" question. To exit

the installer, enter **no** or **n**. In this case, installation is canceled.

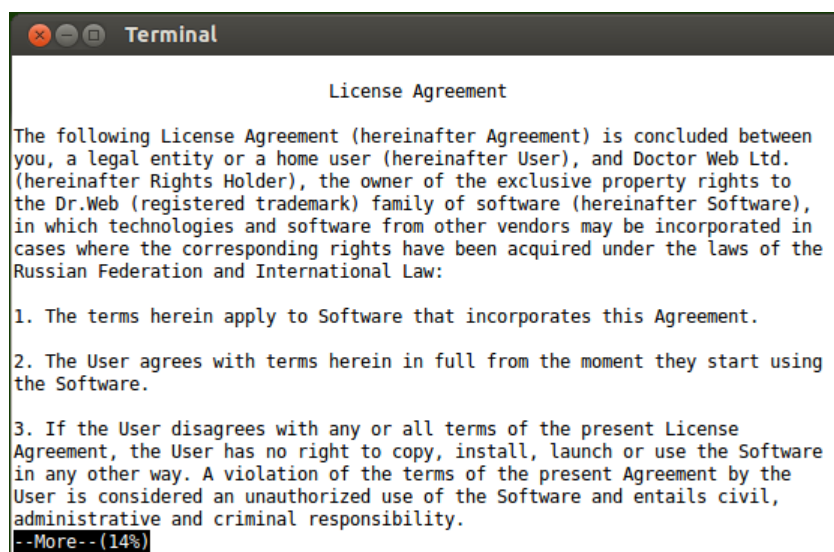

```
Terminal
root@userm:~/drweb-workstations_10.0.0-1401141537-linux_x86# ./setup.sh

This installation script will help you install Dr.Web for Linux

Do you want to continue? (YES/no) _
```

Picture 9. Command prompt to install the product

2. After that, you need to view the terms of the **Doctor Web License agreement** which is displayed on the screen. Press ENTER to line down or SPACEBAR to page down the text. Note that options to line up or page up the **License agreement** text are not provided.

```
Terminal

License Agreement

The following License Agreement (hereinafter Agreement) is concluded between
you, a legal entity or a home user (hereinafter User), and Doctor Web Ltd.
(hereinafter Rights Holder), the owner of the exclusive property rights to
the Dr.Web (registered trademark) family of software (hereinafter Software),
in which technologies and software from other vendors may be incorporated in
cases where the corresponding rights have been acquired under the laws of the
Russian Federation and International Law:

1. The terms herein apply to Software that incorporates this Agreement.

2. The User agrees with terms herein in full from the moment they start using
the Software.

3. If the User disagrees with any or all terms of the present License
Agreement, the User has no right to copy, install, launch or use the Software
in any other way. A violation of the terms of the present Agreement by the
User is considered an unauthorized use of the Software and entails civil,
administrative and criminal responsibility.
--More-- (14%)
```

Picture 10. Viewing License Agreement text

3. After you read the **License agreement** text, you are prompted to accept the terms. Type **yes** or **y** if you accept the **License agreement**. If you refuse to accept them, type **no** or **n**. In the latter case, the installer exits.

```
Terminal
or may arise, including but not limited to, while the User is installing,
updating, supporting, and maintaining the Software (including compatibility
issues with other software products, drivers, etc.), problems due to the
User's misinterpretation of guidance provided in the documentation, or failure
of the Software to meet the User's expectations.

7. The Copyright-holder is not liable to you for possible negative
consequences of any kind, including (without limitation) those caused by the
incompatibility or conflict between the Software and other software products
installed on the same computer, incompatibility or conflict with the computer
hardware

8. The relations between the Rights Holder and the User under this Agreement
are governed by the law of the Russian Federation. All disputes related to
adherence to the terms herein are to be resolved in corresponding courts at
the right holder's location.

9. The Rights Holder can change terms of this agreement unilaterally. A new
version of the agreement shall enter into force as soon as the user is
notified about changes to the agreement by the Rights Holder.

Do you agree with the terms of this license? (yes/NO) _
```

Picture 11. Accepting the License Agreement terms

4. After you accept the terms of the **License Agreement**, installation automatically starts. During the procedure, the information about the installation process, including the list of installed components, will be displayed on the screen.

```

Picture 13. Installation complete message

6. To start working with the installed **Anti-virus**, run the product in one of the [available ways](#).

If the installation process fails due to an error, remove the problems that caused this error and start an installation procedure again.

Custom Installation

To start custom installation, unpack the installation file `<file_name>.run` without starting product installation. For that, use `--noexec` command-line parameter:

```
# ./<file_name>.run --noexec
```

After the command is executed, `<file_name>` subdirectory appears in the same directory where the run file is located. Note that this subdirectory is also created during typical installation as file decompression is a required step before any installation procedure. Moreover, this subdirectory remains on the system after the installation process completes. If necessary, manually remove it.

The created subdirectory is an installation directory that contains auxiliary files and all component packages included in **Dr.Web for Linux**. Each component package `<component_name>` contains two files: `<component_name>.install` and `<component_name>.remove`. These files are command scripts. The first script is used for package installation and the second script performs package removal. Names of all packages containing **Dr.Web for Linux** components start with "drweb" prefix.

To install a certain component, run the appropriate installation file in the console (or console emulator, which is a terminal for graphics mode).

To run an installation script for any component, administrative (root) privileges are required. To gain root privileges, you can use either the `su` command to switch to another user or the `sudo` command to perform an action as a different user.

When installing any of the product components, dependencies are supported; that is, if component installation requires other components, they are checked to be present in the system and, if not, they are installed automatically.

Installing from Dr.Web Repository

Dr.Web for Linux native packages are stored in the official **Dr.Web** repository at <http://repo.drweb.com/drweb/>. After you add the **Dr.Web** repository to the list of those used by your operating system package manager, you can install the product from native packages as you install any other programs from the operating system repositories. Required dependencies are automatically resolved.

All commands, mentioned below, for connecting repositories, import of digital signature keys, installation and removal of packages must be performed with administrative (`root`) privileges. To elevate the privileges, use the `su` command (change the current user) or the `sudo` command (execute the specified command with other user privileges).

Debian, Ubuntu (apt)

The repository for these operating systems is digitally signed. To enable correct operation, import a digital signature key using the following command:

```
wget -O - http://repo.drweb.com/drweb/drweb.key | apt-key add -
```

or

```
curl http://repo.drweb.com/drweb/drweb.key | apt-key add -
```

To connect the repository, add the following line to the `/etc/apt/sources.list` file:

```
deb http://repo.drweb.com/drweb/debian 10.0.0 non-free
```

Besides that, you can obtain the key automatically and connect to the repository of version 10.0.0 via downloading and installing a special DEB packet. Link to download the package: <http://repo.drweb.com/drweb-repo10.deb>.

To install **Dr.Web for Linux** from the repository, use the following commands:

```
apt-get update
apt-get install drweb-workstations
```

You can also use alternative package managers (for example, **Synaptic** or **aptitude**) to install the product. Moreover, it is recommended to use alternative managers, such as **aptitude**, to solve a package conflict if it occurs.

Red Hat Enterprise Linux, Fedora, CentOS (yum)

Add the file with the content mentioned below to the `/etc/yum.repos.d` directory:

For 32-bit version

```
[drweb]
name=DrWeb - 10.0.0
baseurl=http://repo.drweb.com/drweb/el5/10.0.0/i386/
gpgcheck=1
enabled=1
gpgkey=http://repo.drweb.com/drweb/drweb.key
```

For 64-bit version

```
[drweb]
name=DrWeb - 10.0.0
baseurl=http://repo.drweb.com/drweb/el5/10.0.0/x86_64/
gpgcheck=1
enabled=1
```

```
gpgkey=http://repo.drweb.com/drweb/drweb.key
```

Besides that, you can connect to the repository of version 10.0.0 via downloading and installing a special RPM packet. Link to download the package: <http://repo.drweb.com/drweb-repo10.rpm>.

To install **Dr.Web for Linux** from the repository, use the following command:

```
yum install drweb-workstations
```

You can also use alternative package managers (for example, **PackageKit** or **Yumex**) to install the product.

Adjusting SELinux Policies

If the used **Linux** distribution features **SELinux** (Security-Enhanced Linux), you may need to configure **SELinux** security policies to enable correct component operation (for example, operation of the scanning engine) after they are installed.

1. Universal package installation issues

If **SELinux** is enabled, installation from the [installation file](#) (.run) can fail because an attempt to create the **drweb** user, under which **Dr.Web for Linux** components operate, can be blocked.

In case of failure, check the **SELinux** operation mode with the **getenforce** command. The command outputs one of the following:

- **Permissive** – protection is active but a permissive strategy is used: actions that violate the security policy are not denied but information on the actions is logged.
- **Enforced** – protection is active and restrictive strategy is used: actions that violate security policies are blocked and information on the actions is logged.
- **Disabled** – **SELinux** is installed but not active.

If **SELinux** is operating in **Enforced** mode, change it to **Permissive** for the period while the product is being installed. For that purpose, use the **setenforce 0** command, which temporarily (until the next reboot) enables **Permissive** mode for **SELinux**.

Note that regardless of the operation mode enabled with the **setenforce** command, restart of the operating system returns **SELinux** operation to the mode specified in the **SELinux** settings (file with **SELinux** settings usually resides in the `/etc/selinux` directory).

After the product installation successfully completes, enable **Enforced** mode for **SELinux** again before starting the product. For that, use the **setenforce 1** command.

2. Operation issues

In some cases when **SELinux** is enabled, certain auxiliary **Anti-virus** modules (for example, **drweb-se** and **drweb-filecheck** used by **Scanner**) cannot start. If so, object scanning and file system monitoring become unavailable. When an auxiliary module fails to start, the main **Dr.Web for Linux** window displays messages on 119 and 120 errors and information on these errors is also registered by **syslog** (the log is usually located in the `/var/log/` directory).

Messages on 119 and 120 errors can also indicate an attempt to start **Anti-virus** on 64-bit version of the operating system if the 32-bit application support library is missing (see [System Requirements](#)).

SELinux messages are registered in the system log. In general, when **audit** daemon is used on the system, the audit log file is `/var/log/audit/audit.log`. Otherwise, messages on blocked

operations are saved to the general log file located in `/var/log/messages`.

Note that certain **Linux** distributions do not feature the utilities mentioned below. If so, you may need to install additional packages with the utilities.

To create required policies

1. Create a new file with the **SELinux** policy source code (`.te` file). This file defines restrictions applied to the module. The policy source code can be specified in one of the following ways:

- 1) **Using** the `audit2allow` utility, which is the simplest method. The utility generates permissive rules from messages on access denial in system log files. You can set to search messages automatically or specify a path to the log file manually.

Note that you can use this method only if **Anti-virus** violated **SELinux** security policies and these events are registered in the audit log file. If not, wait for such an incident to occur or force-create permissive policies by using the `policygentool` utility (see below).

The `audit2allow` utility resides in the `policycoreutils-python` or `policycoreutils-devel` package (for **RedHat Enterprise Linux**, **CentOS**, **Fedora** operating systems depending on the version) or in the `python-sepolgen` package (for **Debian**, **Ubuntu** OSes).

Please note that for **Fedora** version 20 it is required to install additionally the `checkpolicy` package, otherwise the `audit2allow` utility returns an error.

Example usage:

```
# grep drweb-se.real /var/log/audit/audit.log | audit2allow -M drweb-se
```

In the given example, the `audit2allow` utility performs a search in the `audit.log` file to find access denial messages for `drweb-se` module.

The following two files are created: policy source file `drweb-se.te` and the `drweb-se.pp` policy module ready to install.

If no security violation incidents are found in the system audit log, the utility returns an error message.

In most cases, you do not need to modify the policy file created by the utility. Thus, it is recommended to go to [step 4](#) for installation of the `drweb-se.pp` policy module. Note that the `audit2allow` utility outputs invocation of the `semodule` command. By copying the output to the command line and executing it, you complete [step 4](#). Go to [step 2](#) only if you want to modify security policies which were automatically generated for **Dr.Web for Linux** components.

- 2) **Using** the `policygentool` utility. For that purpose, specify name of the module operation with which you want to configure and the full path to the executable file.

Note that the `policygentool` utility, included in the `selinux-policy` package for **RedHat Enterprise Linux** and **CentOS Linux** OS, may not function correctly. If so, use the `audit2allow` utility.

Example of policy creation via `policygentool`:

- o for `drweb-se` (used by the anti-virus engine):

```
# policygentool drweb-se /opt/drweb.com/bin/drweb-se.real
```

- o for **drweb-filecheck** (used by **Scanner**):

```
# policygentool drweb-filecheck /opt/drweb.com/bin/drweb-filecheck.real
```

You will be prompted to specify several common domain characteristics. After that, three files that determine the policy are created for each of the modules:

<module_name>.te, <module_name>.fc and <module_name>.if.

2. If required, edit the generated policy source file <module_name>.te and then use the **checkmodule** utility to create a binary mapping of the local policy source file (.mod file).

Note that to ensure success of the command, the **checkpolicy** package must be installed in the system.

Example usage

```
# checkmodule -M -m -o drweb-se.mod drweb-se.te
```

3. Create an installed policy module (.pp file) with the use of the **semodule_package** utility.

Example

```
# semodule_package -o drweb-se.pp -m drweb-se.mod
```

4. To install the created policy module, use the **semodule** utility.

Example

```
# semodule -i drweb-se.pp
```

For details on **SELinux** operation and configuration, refer to documentation for the used **Linux** distribution.

Product Files Location

After installation of **Dr.Web for Linux**, its files reside in the /opt, /etc, and /var directories of the file system.

Structure of the used directories is as follows:

Directory	Content
/opt/drweb.com/	Executable files of product components and basic libraries required for operation of Anti-virus
/etc/opt/drweb.com	Files with component settings (by default) and license key file required for operation of Anti-virus in Standalone mode
/var/opt/drweb.com	Virus databases, Dr.Web Virus-Finding Engine , temporary files, and additional libraries required for Anti-virus operation.

Removing Dr.Web for Linux

Depending on the method of **Dr.Web for Linux** installation, you can remove the suite in one of the following ways:

1. **Starting the uninstall program** to remove the universal package distribution (for graphics or command-line mode, depending on the environment).

2. [Deleting packages](#) installed from the **Doctor Web** repository via the package system manager

Removing Universal Package

You can remove **Dr.Web for Linux** installed from the distribution with the [universal package](#) for UNIX systems via the application menu of the desktop environment, or via the command line.

Removing program via application menu

On the application menu, click the **Dr.Web** item and select **Remove Dr.Web components**. Removal Wizard for graphics mode will start.

Removing program via command line

To remove **Anti-virus**, run the `remove.sh` script, which resides in the `/opt/drweb.com/bin` directory, using the following command:

```
# /opt/drweb.com/bin/remove.sh
```

Then an uninstall program starts (either in graphics or command-line mode, depending on the environment).

To start the uninstall program directly from the command line, use the following command:

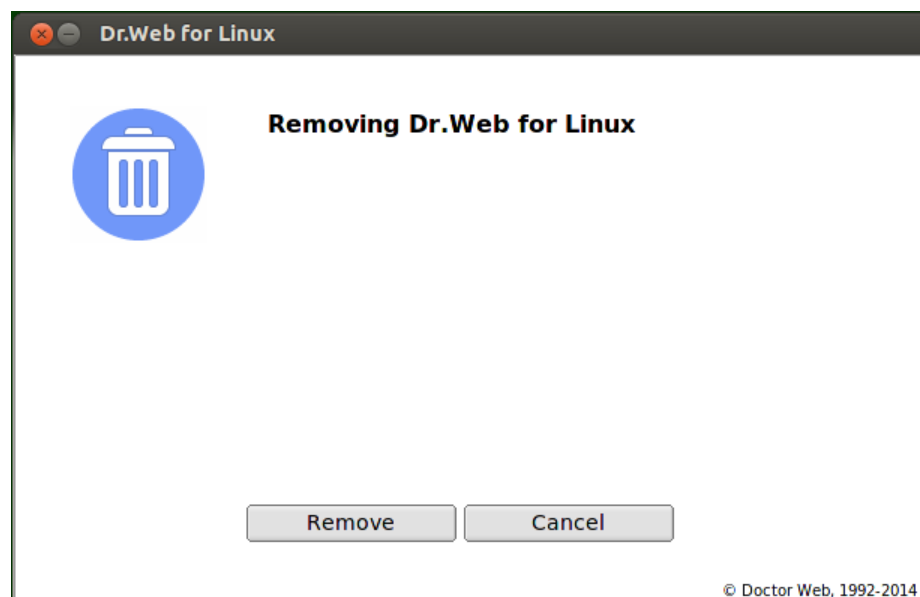

```
# /opt/drweb.com/bin/uninst.sh
```

Removal of **Anti-virus** is described in the following chapters:

- [Removing in Graphics Mode](#)
- [Removing from Command Line](#)

Removing in Graphics Mode

Once the Removal wizard starts in graphics mode, its welcome page where you can select the language in the drop-down list in the upper-right corner.

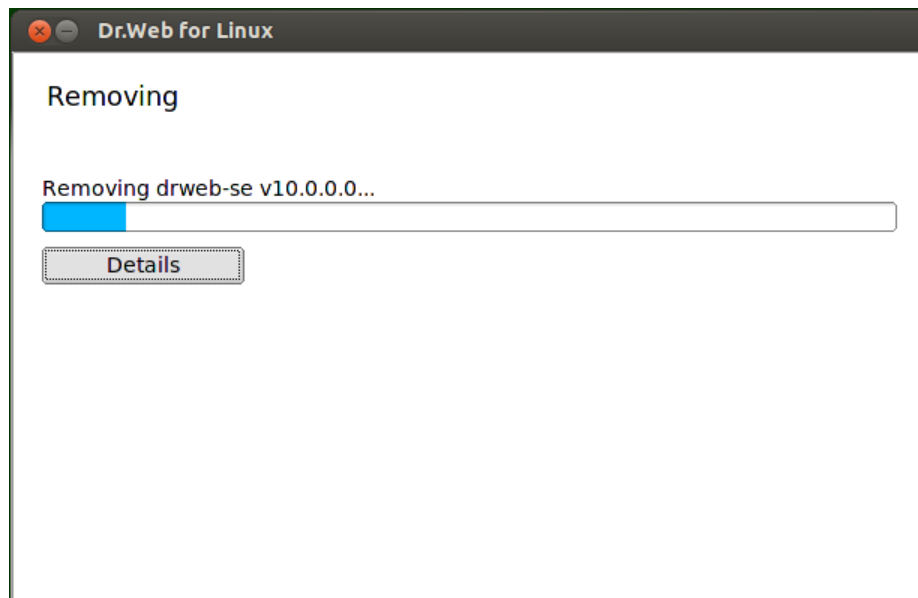

Picture 14. Welcome page

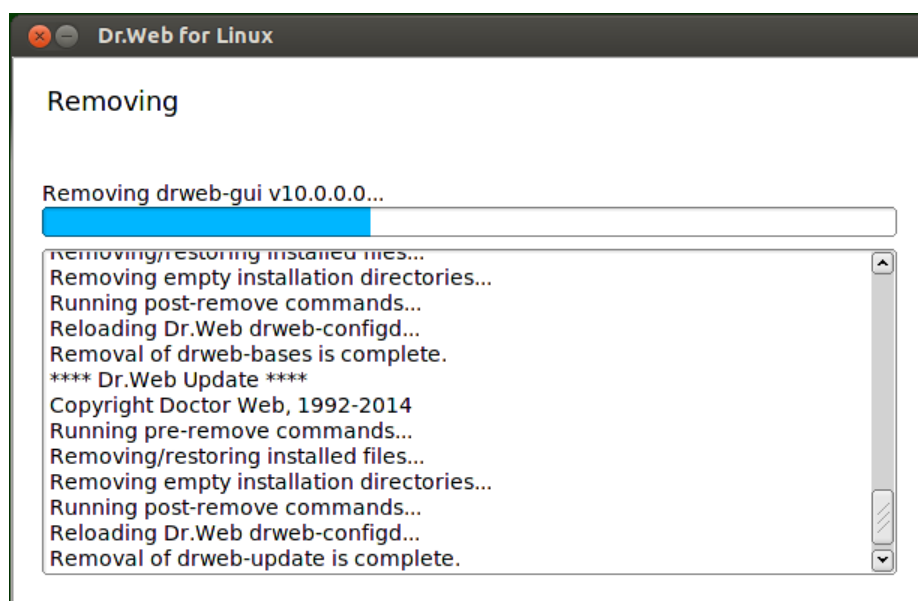

To uninstall **Dr.Web for Linux**, click **Remove**. To close the Removal Wizard, click **Cancel**.

After the removal starts, a page with the progress bar opens. If necessary, you can click the **Details** button and view the log.

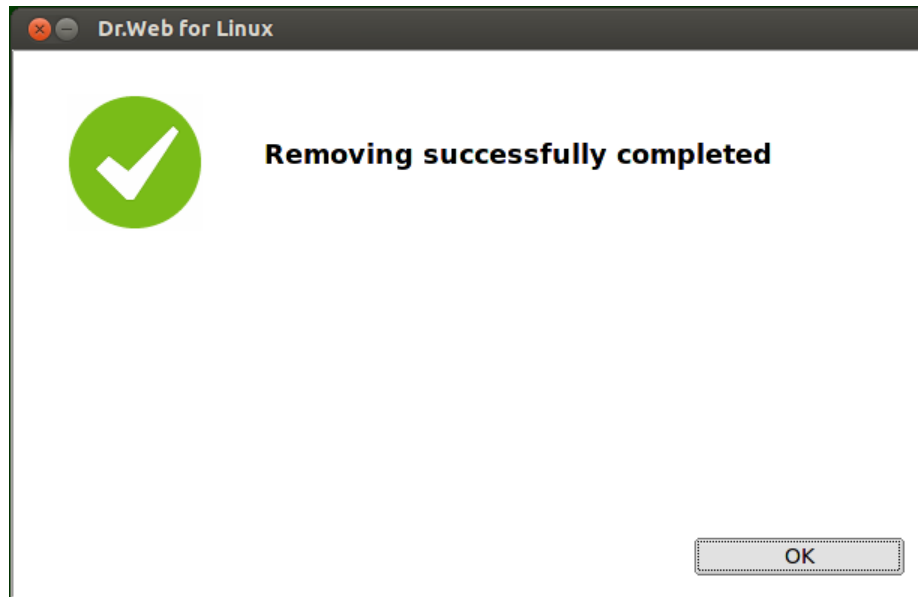

Picture 15. Removal progress bar

Picture 16. Viewing the log

After **Dr.Web for Linux** files are successfully removed and all necessary changes are made to the system files, the Removal Wizard displays the final page notifying on successful operation results.

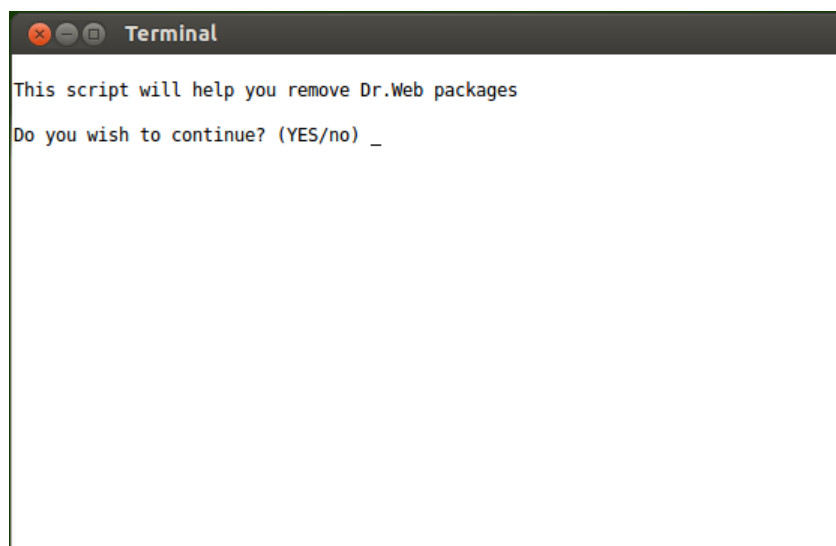

Picture 17. Removal Wizard results page

To close the Removal Wizard, click **OK**.

Removing from Command Line

Once the removal program for command-line mode starts, the command prompt displays on the screen.

1. To start removal, enter **yes** or **y** in response to the "Do you wish to continue?" question. To exit the removal program, type **no** or **n**. In this case, removal will be canceled.

Picture 18. Command prompt to uninstall the product

2. After that, a list of installed **Dr.Web for Linux** components is output.

```
Terminal
[ ] 7 Dr.Web Secutiry Suite agent (10.0.0.0)
[ ] 8 Dr.Web Antivirus Filecheck backend (10.0.0.0)
[ ] 9 Dr.Web GUI (10.0.0.0)
[ ] 10 Essential third party libraries needed for Dr.Web on x86 systems
(10.0.0.0)
[ ] 11 OpenSSL - Secure Sockets Layer and cryptography shared libraries
and tools (10.0.0.0)
[ ] 12 Google protobuf needed for Dr.Web (10.0.0.0)
[ ] 13 Qt, third party C++ libraries needed for Dr.Web (10.0.0.0)
[ ] 14 Dr.Web Antivirus Daemon SE (10.0.0.0)
[ ] 15 Dr.Web Spider (10.0.0.0)
[ ] 16 Dr.Web Updater (10.0.0.0)

To select a package you want to remove or deselect some previously
selected package - enter the corresponding package number and press Enter.

You may enter A or All to select all the packages, and N or None to deselect al
l of them.
Enter R or Remove to remove selected packages.
Enter 0, Q or Quit to quit the dialog.
All values are case insensitive.
Select: _
```

Picture 19. Viewing the list of installed components

3. To continue the removal, select the components to be deleted. For selecting a certain component, enter its number in the list. Note that all packages depending on a selected package are also automatically selected for removal.

- To select all listed components, type **A** or **All** instead of a component number
- To reject selection of the packages, type **N** or **None** instead of a component number.
- To cancel removal, type **0**, **Q** or **Quit** instead of a component number. If so, the removal program exits.

To select a package you want to remove or deselect some previously
selected package - enter the corresponding package number and press Enter.

You may enter A or All to select all the packages, and N or None to deselect al
l of them.
Enter R or Remove to remove selected packages.
Enter 0, Q or Quit to quit the dialog.
All values are case insensitive.
Select:
```

Picture 20. Selection of components to be removed

4. After you select the components to be removed, type **Remove** or **R** to start the process.

```
Terminal
A list of packages marked for removal:
drweb-bases
drweb-boost151
drweb-common
drweb-configd
drweb-epm10.0.0-libs
drweb-epm10.0.0-uninst
drweb-esagent
drweb-filecheck
drweb-gui
drweb-libs
drweb-openssl10
drweb-protobuf7
drweb-qt
drweb-se
drweb-spider
drweb-update
Are you sure you want to remove the selected packages? (YES/no) _
```

Picture 21. Component removal confirmation

5. On the next page, view the list of packages selected for removal and confirm the action by typing **yes** or **Y**. If you choose not to delete the components, exit the removal program by typing **no** or **N**.

```

7. Once the removal completes, the program outputs the corresponding message and exits.

Removing Product Installed from Repository

All commands mentioned below for package removal require administrative (`root`) privileges. To elevate the privileges, use the `su` command (change the current user) or the `sudo` command (execute the specified command with other user privileges).

Debian, Ubuntu (apt)

To remove the root metapackage of **Dr.Web for Linux**, enter the following command:

```
apt-get remove drweb-workstations
```

To remove all installed **Dr.Web** packages, enter the following command (in certain operating systems, a '*' character must be escaped: '*'):

```
apt-get remove drweb*
```

To automatically remove all packages that are no longer used, enter also the following command:

```
apt-get autoremove
```

Note special aspects of removal using the `apt-get` command:

1. The first mentioned version of the command removes only the `drweb-workstations` package; all other packages that could be automatically installed to resolve dependencies remain in the system.
2. The second mentioned version of the command removes all packages which name starts with "drweb" (standard name prefix for **Dr.Web** products). Note that this command removes all packages with this prefix, not only those of **Dr.Web for Linux**.
3. The third mentioned version of the command removes all packages that were automatically installed to resolve dependencies of other packages and are no longer necessary (e.g., due to their removal). Note that this command removes all packages that are not used, not only those of **Dr.Web for Linux**.

You can also use alternative managers (for example, **Synaptic** or **aptitude**) to remove packages.

Red Hat Enterprise Linux, Fedora, CentOS (yum)

To remove all installed **Dr.Web** packages, enter the following command (in certain operating systems, a '*' character must be escaped: '*'):

```
yum remove drweb*
```

Note special aspects of removal using the **yum** command:

This version of the command removes all packages which name starts with "drweb" (standard name prefix for **Dr.Web** products). Note that this command removes all packages with this prefix, not only those of **Dr.Web for Linux**.

You can also use alternative managers (for example, **PackageKit** or **Yumex**) to remove packages.

Working with Dr.Web for Linux

You can work with **Dr.Web for Linux**

- Via the graphical interface (in graphic desktop environment)
- From the command line of the operating system, including terminal emulators for graphics mode

To start **Anti-virus** in graphics mode, select the **Dr.Web for Linux** item in the application menu or enter the following command in the operating system command line

```
$ drweb-gui
```

In this case, if the desktop environment is available, **Dr.Web for Linux** is started in graphics mode.

For details on managing the **Anti-virus** operation, refer to the [Operation from the command line](#) section.

Under normal operation of **Dr.Web for Linux**, the [state indicator](#) appears in the notification area (if desktop environment is available) and provides access to the application menu or displays pop-up notifications. The indicator, as well as all other service components, starts automatically and its operation does not require user intervention.

Regardless of the selected way to install **Dr.Web for Linux**, after the installation completes, you need either to activate the license, or install the key file if already obtained, or connect **Anti-virus** to the central protection server (see [License Management](#)).

Until you do that, **anti-virus protection is disabled**.

Operating in Graphics Mode

Dr.Web for Linux graphical interface is a windowed application which functions in the graphical desktop environment and is used for management of **Anti-virus** operation.

Main functions

The graphical interface of **Dr.Web for Linux** allows users to

1. View status of **Dr.Web for Linux** operation, including status of virus databases and period of license validity
2. [Start and stop SpIDer Guard](#)
3. [Start and stop SpIDer Gate](#)
4. Start [file scanning](#) on demand in one of the following modes:
 - **Express scan** to check system files and most critical system objects
 - **Full scan** to check all accessible files in the file system
 - **Custom scan** to check only those files and directories that are specified by the user, or special objects (disk boot sectors, active processes)

You can specify files to be scanned either by selecting files and directories before scanning starts or by dragging and dropping them from the file manager window to the Main page (see below) or Scan page of the **Anti-virus** window.

5. [View all threats](#) detected on the computer by **Dr.Web for Linux** during current operation in graphics mode, including neutralized and skipped threats and quarantined objects.
6. [View quarantined objects](#), delete, or restore them

7. Configure parameters of **Dr.Web for Linux** operation including:
 - Actions to be automatically applied to detected threats (depending on their type) by **Scanner** and **SpIDer Guard**
 - List of files and directories that should not be scanned by **Scanner** or checked by **SpIDer Guard**
 - Black and white lists of websites, used by **SpIDer Gate**, and parameters for scanning files downloaded from the Internet
 - Schedule of scanning tasks including the period and type of performed scanning, and list of objects that are to be scanned
 - Operation mode (status of connection to the central protection server)
8. License management (performed via License Manager).

To enable correct operation, ensure that all service components are running before **Anti-virus** is started; otherwise, it shuts down immediately after the startup having displayed the corresponding warning message.

Under normal operation, all necessary components are started automatically and do not require user intervention.

Appearance

The appearance of the **Anti-virus** Main page is shown in the picture below.

Picture 24. Main window of the Dr.Web for Linux

The left pane of the window displays navigation buttons which allow to perform the following actions.

Button	Description
Continuously enabled	
	<p>Opens the Main page where you can</p> <ul style="list-style-type: none">• Enable or disable SpIDer Guard• Start scanning of file system objects (files, boot records) and running processes• View the virus database status and update the databases, if necessary• Start License Manager to view the current license status and register a new license, if necessary

Button	Description
	Opens the Quarantine page where you can view quarantined files, delete them, or restore.
	Opens the page where you can start file scanning, select the scanning type and specify objects to be scanned, including currently running processes.
	Opens the page with Anti-virus settings including <ul style="list-style-type: none">• Scanner settings• SpIDer Guard settings• SpIDer Gate settings• Run scanings by a schedule Moreover, on this page you can configure settings of central protection mode.
	Provides access to Doctor Web reference materials and resources <ul style="list-style-type: none">• Product information• User manual• Official forum• Technical support• Personal user's webpage My Dr.Web. All links open webpages in the browser installed in your system.
Visible depending on certain conditions	
	Opens the page with the list of incomplete scanning tasks. The button is visible on the pane only if at least one scanning task is in progress.
	Opens the page with results of complete scanning tasks. The button changes its color depending on the scanning results
	1) Green – all scanning tasks completed successfully; all detected threats, if any, are neutralized
	2) Red – some of the detected threats are not neutralized
	3) Yellow – at least one of the scanning tasks failed
	The button is visible on the pane only if at least one scanning task was started.
	Opens the page where threats detected by Scanner or SpIDer Guard are listed. The button is visible on the pane only if at least one threat is detected.
	Opens the page with SpIDer Guard settings. The button is visible on the pane only if the page with SpIDer Guard settings was opened from the Main page.
	Opens the page with SpIDer Gate settings. The button is visible on the pane only if the page with SpIDer Gate settings was opened from the Main page.
	Opens the page with update settings. The button is visible on the pane only if the page with update settings was opened from the Main page.
	Opens the License Manager page. The button is visible only if the License Manager page was opened from the Main page.

Main Page

On the Main page you can find the target pane where you can drag and drop files and directories to be scanned. The pane is marked with the **Drag files here or click to select** label and an image of a down arrow. After objects are dragged and dropped from the file manager to the Main page, their [scanning](#) starts (if the **Scanner** is already scanning other objects, the new scanning task is [queued](#)).

On this page, the following buttons are available:

- **SpIDer Guard** – displays the current status of **SpIDer Guard**. Click this button to open the **SpIDer Guard** page with the [component settings](#) where you can start or stop **SpIDer Guard** as well as view statistics on its operation.
- **SpIDer Gate** – displays the current state of **SpIDer Gate**, which monitors access to web resources. If clicked, opens the [control page](#), where you can start or stop **SpIDer Gate** and view statistics on its operation.
- **Scanner** – allows to open the page where you can [start scanning](#) of files and other file system objects (for example, boot records).
- **Update** – displays the current status of virus databases. Click this button to open the page with [update status](#) where you can start an updating process, if required.
- **License** – displays status of the current license. Click this button to open the **License Manager** page where you can find more detailed information on the current license as well as purchase and register a new license if required.

Starting and Shutting Down Graphical Interface

Starting Anti-virus in graphics Mode

To start **Dr.Web for Linux** in graphics mode, do one of the following:

- Select **Dr.Web for Linux** item on the **Applications Menu**.
- Right-click the **Anti-virus indicator** icon in the notification area and select **Open Anti-virus**.

You can also start **Dr.Web for Linux** in graphics mode from the [command line](#). You can use this option only if graphical environment is accessible in the command-line mode, for example, when working in a terminal window.

Shutting down Anti-Virus

To shut down **Dr.Web for Linux**, close the window using the standard close button on the title bar.

Note that service components, including the state indicator, **SpIDer Guard**, and **SpIDer Gate**, continue their operation after **Anti-virus** graphical interface shuts down (unless they are disabled by the user).

Under normal operation, operation of all necessary service components does not require user intervention.

State Indicator in Notification Area

After the user logs on, a state indicator appears in the notification area as the **Anti-virus** icon (if supported by the used graphical environment). The indicator displays the application state and provides access to the **Anti-virus** menu. If any problem occurs (e.g., the virus databases are outdated, license is about to expire), the indicator displays an exclamation mark:

The indicator is used for displaying pop-up notifications that inform the user on important events of **Anti-virus** operation, such as:

- Detected threats (including those detected with **SpIDer Guard** and **SpIDer Gate**)
- License validity period is about to expire

Once the icon is clicked, the **Anti-virus** menu displays on the screen.

Picture 25. Dr.Web for Linux menu

When you select the **Open Anti-virus** item, **Anti-virus** [main window](#) appears on the screen; that is, **Anti-virus** operation switches to graphical mode. When you select the **My Dr.Web** item, your personal page on the **Doctor Web** official website opens in the browser (a valid Internet connection is required).

Selection of **Enable/Disable SpIDer Gate** or **Enable/Disable SpIDer Guard** items starts or stops operation of the corresponding monitor. Note that you need to authenticate as a user with administrative privileges to disable operation of any monitor (refer to the [Managing Application Privileges](#) section).

Selection of the **Update** item forces an update procedure to start.

If the indicator notifies on problems in **Anti-virus** operation, the icon of the component, which caused the problem, also displays an exclamation mark, for example: .

If the indicator displays a critical error mark , and drop-down menu contains only one disabled item **Loading...**, it means that **Anti-virus** cannot start because some core components are unavailable. If this status is permanent, try [to resolve](#) this error manually or contact [technical support](#).

In different desktop environments, appearance and behavior of the indicator can differ from the ones described above; for example, icons may not display in the drop-down menu.

Threat Detection and Neutralization

Search and neutralization of threats can be started either by **Scanner** on [user demand](#), or as scheduled, or by **SpIDer Guard**.

- To enable or disable **SpIDer Guard** and **SpIDer Gate**, use the [context menu](#) in the notification area or open the corresponding page with the monitor settings (refer to the [Monitoring File System](#) and [Monitoring Internet Access](#) sections).
- To view current tasks of **Scanner** or manage them, open the page for [task management](#).
- To view threats detected by **Scanner** or during **SpIDer Guard** checks, open the [page with listed threats](#).
- To manage quarantined threats, open the [Quarantine view](#) page.
- To configure **Dr.Web for Linux** reaction on detected threats, open the [Settings page](#). On this page, you can also set [schedule](#) to start scanning.

Please note that in case if the **Anti-virus** is operating in [Central protection](#) mode and launching of scanning by user demand is prohibited on central protection server, the [Scan](#) page of the **Anti-virus** window will be disabled. Moreover, in this case the **Scanner** will not launch scanings even if they are [scheduled](#).

Scanning on Demand

Scanning Types

On user demand, scanning in one of the following modes can be started:

- *Express scan* – scan of critical system objects that are at high risk to be compromised (boot records, system files, etc.)
- *Full scan* – scan of all file system objects available for the user under whom **Anti-virus** is started
- *Custom scan* – scan of file system objects or other special objects specified by the user

If **Anti-virus** is operating in [Central protection](#) mode and launch of scanning at user request is prohibited on the Central protection server, this page is disabled.

Scanning can increase processor load, which can cause the battery to discharge faster. Thus, it is recommended to perform a scan of a portable computer when it is plugged in.

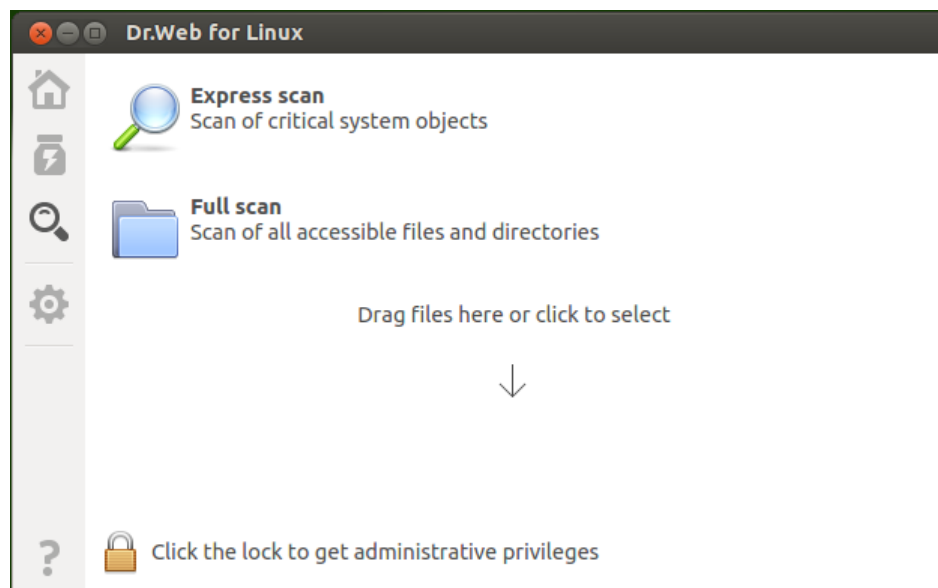

Starting Scanning

To start scanning

- Click the  button on the navigation pane.
- or
- Click the **Scanner** button on the [Main page](#).

The page with scan types opens. To start *Express* or *Full* scan, click the corresponding button. Once one of these buttons is clicked, scanning process automatically starts.

Picture 26. Select scan type page

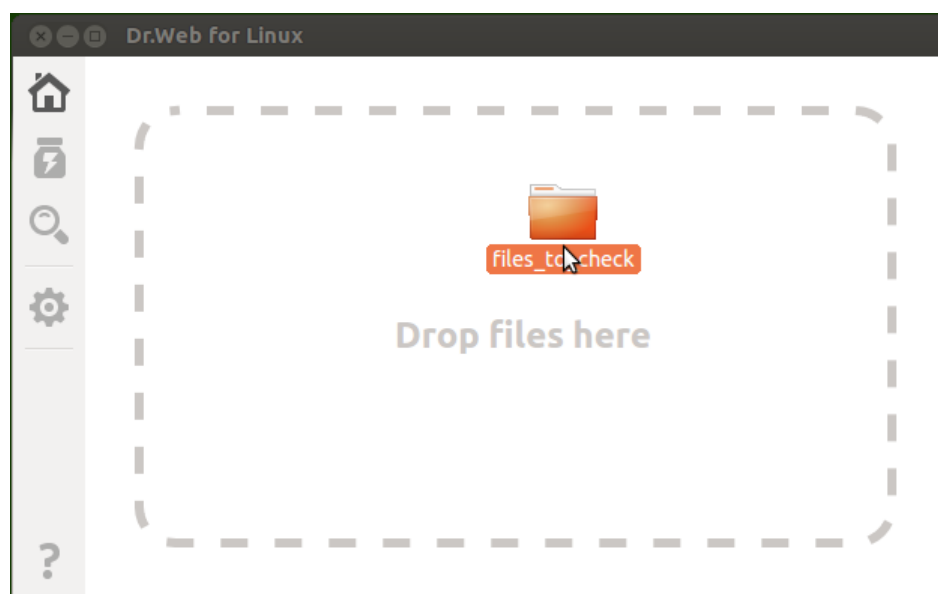

Scanning is performed with current application privileges. If the user whose privileges are currently active does not have superuser permissions, all files and directories that are not accessible to this user cannot be scanned. To enable check of all required files on which you do not have owner permissions, elevate the application privileges before scanning starts. For details, refer to the [Managing Application Privileges](#) section.

To start *Custom scan* of certain files and directories, do one of the following:

- **Drag and drop required objects**

Drag and drop required files and directories from the system File Manager window to the area marked with a special label **Drag files here or click to select** and an image of a down arrow. You can also drag and drop the objects to the [Main page](#).

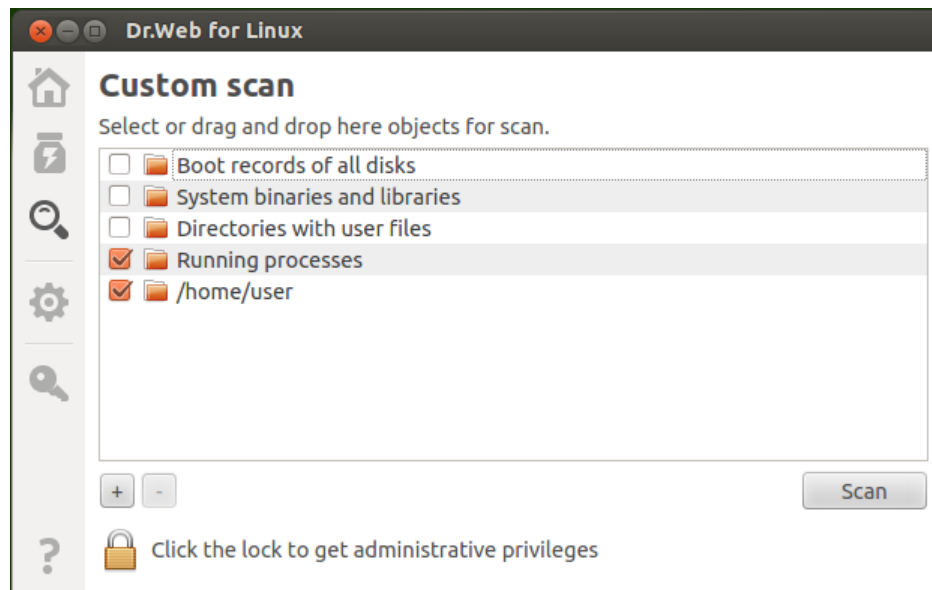

When dragging objects over the page, it changes to the pane indicated with a dashed line and with the **Drop files here** label. To start scanning, drop the dragged objects onto the target area by releasing the mouse button.

Picture 27. Target area where objects are dropped for scanning

- **List the objects to be scanned.**

To select the objects for scanning, click the target area. The window where you can select system objects for Custom scan opens.

Picture 28. List of objects for scanning

The list of objects for Custom scan contains four predefined items:

- *Boot records of all disks.* If you enable this item, all boot records of all available disks are selected for scanning.
- *System binaries and libraries.* If you enable this item, all directories with system binaries are selected for scanning (`/bin`, `/sbin`, etc.);
- *Directories with user files.* If you select this item, all directories where user files and files of the current session reside are selected for scanning (`/home/<username>` (`~`), `/tmp`, `/var/mail`, `/var/tmp`).
- *Running processes.* If you select this item, binary executable files containing code of currently running processes are selected for scanning. At that, if a threat is detected, not only the malicious object is neutralized but also the active process is terminated.

Editing the list of Custom scan objects

If required, you can add custom paths to the list of objects for scanning. For that purpose, drag and drop necessary objects (paths to the objects are automatically added to the list) or click the "+" button below the list. In this case, a standard dialog window opens, where you can select required objects (a file or a directory). After you select an object, click **Open**. To remove all selected paths from the list, click the "-" button.

Hidden files and directories are not displayed in the file chooser by default. To view such objects, right-click the list of files in the file chooser and select **Show hidden files**.

The first four items in the list are predetermined and cannot be removed even if the corresponding check boxes are selected. Moreover, if at least one of the predetermined item is selected, the "-" button is unavailable.

Starting Custom scan of listed objects

To start Custom scan of listed objects, select all required files or directories and click **Scan**. Once the button is clicked, scan of the selected objects starts.

After scanning starts, the task is added to the queue which contains all scanning tasks of the current session: complete tasks, tasks in progress, and pending tasks. You can view the list of tasks and manage them on the [scan task management page](#).

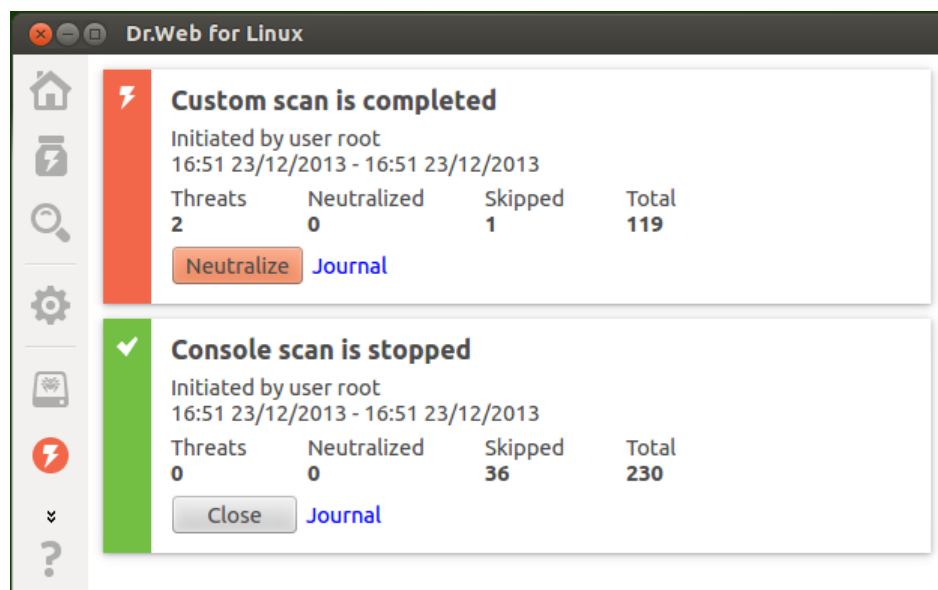

Managing Scan Tasks

You can view the list of created tasks and tasks in progress on the special **Dr.Web for Linux** page. If at least one task is queued, a button that opens the page with the task list becomes visible on the [navigation pane](#). Depending on the status of the queued tasks, the button has one of the following icons:

	At least one of the tasks is not complete (icon is animated).
	All scanning tasks in the list are complete or stopped by the user; no threat is detected or all detected threats are successfully neutralized.
	All scanning tasks in the list are complete or stopped by the user; some of the detected threats are not neutralized.
	All scanning tasks in the list are complete or stopped by the user. Some of the tasks failed.

Tasks are sorted by date (from the first created task to the most recent).

Picture 29. Task management page

For each listed task, the following information is available:

- Scan type (*Express scan*, *Complete scan*, and *Custom scan*, or other types of scanning; for details, see below);
- Name of the user who started scanning (if unknown, the system UID is displayed);
- Date of task creation and completion (if complete);
- Number of detected threats, neutralized threats, skipped files, and total number of scanned objects.

The status of the task is indicated with the colour mark assigned to the listed task. The following colors are used:

- – Scanning is not complete or is pending.

- Scanning is complete or stopped by the user; no threat is detected or all detected threats are neutralized.
- Scanning is stopped due to an error.
- Scanning is complete or stopped by the user; at least one detected threat is not neutralized.

Note that the list contains scanning tasks performed by **Scanner** in the current session, not just the tasks created by the user in graphics mode. Other types of scanning can be the following:

- *Console scanning* – scanning initiated by the user or an external application via the command-line interface;
- *Centralized scanning* – scanning initiated by the central protection server;
- *Scheduled scanning* – scanning started automatically according to the specified schedule.

On the task description area, one of the following buttons is available:

- **Cancel** – cancel the pending task. The button is available if the task is pending. Once the button is clicked, the task completes. Information on the task remains in the list.
- **Stop** – stop the task which is in progress. After you click this button, the stopped task cannot be resumed. The button is available if the task is in progress. Information on the stopped task remains in the list.
- **Close** – close information on the complete task and delete the task from the list. The button is available if the task is not complete and if all detected threats are neutralized.
- **Neutralize** – neutralize threats. The button is available if the task is complete and some of the detected threats are not neutralized.
- **Details** – open the list with detected threats and neutralize them. The button is available if the task is complete and some of the detected threats are not neutralized.

Click **Journal** to display information on scanning results including detailed information on the task and the list of detected threats, if any.

Picture 30. Detailed information on scanning results

Note: File systems of UNIX-like OS, such as **Linux**, can contain special objects that appear as named files but are not actual files containing data (for example, such objects are symbolic links, sockets, named pipes, and device files). They are called *special* files as opposed to usual (*regular*) ones. **Anti-virus** always skips special files during scanning.

Click **Export** to save information on the scanning process to the text file. Click the name of a detected threat to open a webpage with information on the threat in your browser (a threat name is a link to the official **Doctor Web** website; a valid Internet connection is required).

To any threat detected during scanning which was started in graphics mode (including a scheduled scanning), **Anti-virus** applies [actions](#) that are specified in the [settings](#) on the **Scanner** tab.

Note that threat neutralization settings specified on the **Scanner** tab are not used for *centralized* and *console* scanning.

To view all detected threats, open the [page with listed detected threats](#).

Monitoring File System

SpIDer Guard is an anti-virus monitor which checks all created and modified file system objects.

On the **Anti-virus** main window, you can manage **SpIDer Guard** operation

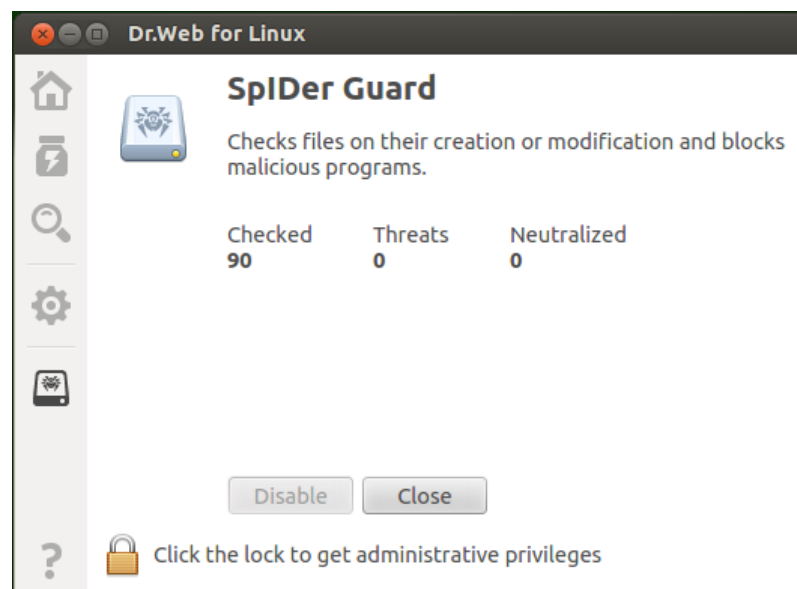

- Start and stop file system monitoring.
- View statistics on component operation and list of detected threats.
- Configure the following operation parameters:
 - Reaction to detected threats
 - List of exclusions

Operation Management

You can start and stop **SpIDer Guard**, as well as view statistics on its operation on a special page.

To open the page, click **SpIDer Guard** on the [Main page](#) or click the button on the navigation pane (visible only if the monitor settings page was opened from the Main page).

Picture 31. SpIDer Guard management page

On the monitor settings page, the following information is available:

- Status of **SpIDer Guard** and information on startup errors (if any)

- Statistics on **SpIDer Guard** operation (number of checked objects, number of detected threats, number of neutralized threats)

To enable monitoring of the file system, click **Enable**. To disable monitoring, click **Disable**.

To disable file system monitoring, the application must have elevated privileges. For details, refer to [Managing Application Privileges](#).

If **Anti-virus** is operating in [Central protection](#) mode, the option to enable/disable **SpIDer Guard** can be blocked by the administrator and become unavailable.

Status of the file system monitor **SpIDer Guard** (enabled or disabled) is indicated with one of the following icons:

– **SpIDer Guard** is enabled and is protecting the file system.

– **SpIDer Guard** is disabled by user or terminated due to an error and is not protecting the file system.

To close the **SpIDer Guard** settings page, click **Close**.

The list of threats detected by **SpIDer Guard** in the current session of the **Dr.Web for Linux** GUI displays on the [page with listed threats](#) (the page is available only if at least one threat was detected).

Configuring SpIDer Guard

To configure **SpIDer Guard** settings, open the [Settings page](#) and click

- **SpIDer Guard** [tab](#) to specify reaction on detected threats
- **Exclusions** [tab](#) to list objects to be excluded from file system monitoring.

SpIDer Guard issues

If **SpIDer Guard** failure is detected, error information is displayed on the management page. To resolve the problem, refer to [Appendix D](#), where you can find detailed description of known errors.

Monitoring Internet Access

SpIDer Gate performs continuous monitoring of Internet access. The monitor prevents access to websites added to black lists and checks downloaded files for viruses and other threats.

The **Dr.Web for Linux** window provides for managing **SpIDer Gate** operation, namely

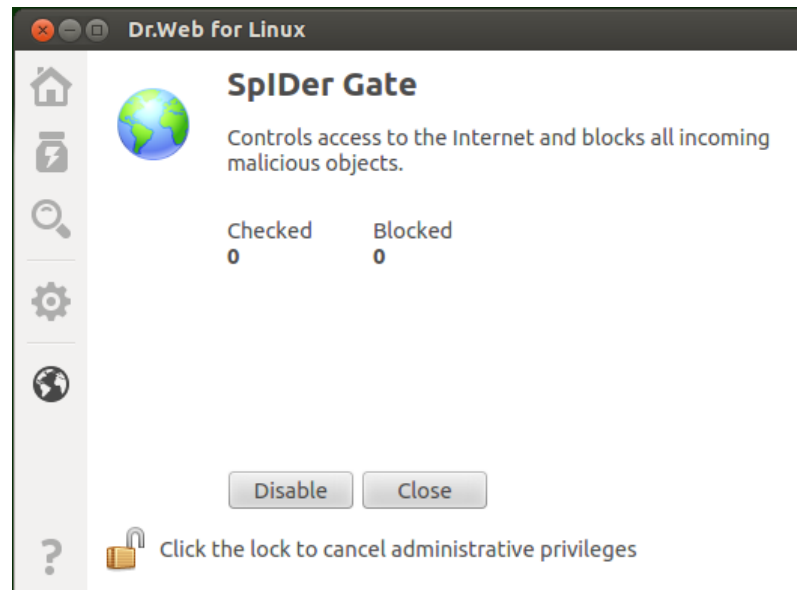

- Start and stop monitor operation
- View statistics on component operation, list of blocked objects and blocked access attempts
- Configure the following Internet monitoring parameters:
 - Categories of web resources access to which is blocked
 - User black and white lists of web resources
 - Parameters of scanning files downloaded from the Internet.

Managing SpIDer Gate Operation

You can start and stop **SpIDer Gate** operation as well as view its operational statistics on the special page of the **Anti-virus** window. To open it, you can either click **SpIDer Gate** on the [Main page](#) or

click  on the navigation pane (visible only if the monitor settings page was opened from the Main page).

Picture 32. SpIDer Gate management page

On the monitor settings page, the following information is available:

- Status of **SpIDer Gate** (enabled or disabled), and information on startup errors (if any)
- Web monitoring statistics (number of checked access attempts, number of blocked threats)

To start monitoring Internet access, click **Enable**. To stop monitoring Internet access, click **Disable**.

To disable web monitoring, the application must have elevated privileges. For details, refer to [Managing Application Privileges](#).

If **Anti-virus** is operating in [Central protection](#) mode, the option to enable/disable **SpIDer Gate** can be blocked by the administrator and become unavailable.

Status of the web monitor **SpIDer Gate** (enabled or disabled) is indicated with one of the following icons:

– **SpIDer Gate** is enabled and is monitoring access to Internet resources.

– **SpIDer Gate** is disabled by user or terminated due to an error and is not monitoring access to Internet resources (access to websites is not restricted and downloaded files are not checked).

To close the **SpIDer Gate** settings page, click **Close**.

Configuring SpIDer Gate

To configure **SpIDer Gate** settings, open the [Settings page](#) and the **SpIDer Gate** [tab](#).

SpIDer Gate Issues

If **SpIDer Gate** failure is detected, error information is displayed on the management page. To resolve

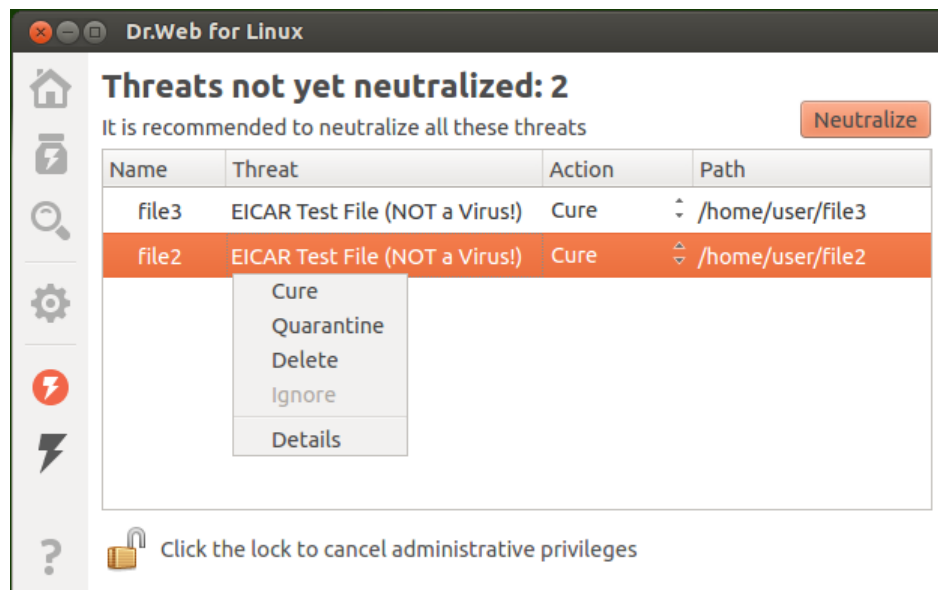

the problem, refer to [Appendix D](#), where you can find detailed description of known errors.

Viewing Detected Threats

The list of threats detected by **Scanner** and **SpIDer Guard** during the current **Anti-virus** session is displayed on the special window page which is available only if at least one threat was detected.

If threats were detected, you can open this page by clicking the button on the GUI navigation pane.

Picture 33. Page with listed threats

In the list, the following information is available for each detected threat:

- Name of the malicious object
- Name of the [threat](#) (according to the **Doctor Web** classification)
- [Action](#) applied (or to be applied) to the threat
- Path to the malicious object

Neutralized threats display in the list as grayed out items.

Neutralizing detected threats

If some of the listed threats are not neutralized, the **Neutralize** button above the list becomes available. Once the button is clicked, actions specified in the corresponding **Action** fields are applied to the threats. If an attempt to neutralize a threat fails, the listed item is displayed red and an error message appears in the **Action** field.

By default, an action to be applied to a threat is selected according to the settings of the component which detected the threat. You can configure actions applied to threats of a certain type by **Scanner** and **SpIDer Guard**. For that purpose, open the corresponding tab on the [Settings page](#) and adjust the settings.

If it is necessary to apply an action which is different from the one specified in the settings, click the **Action** field and select the required action on the menu.

You can select multiple items in the threat list at a time. To do that, select the items with a mouse button while holding down CTRL and SHIFT keys.

- When you hold down a CTRL key, threats are selected one by one.
- When you hold down a SHIFT key, threats are selected contiguously.

After you select threats, you can apply a required action to them by right-clicking in the selected area and then clicking the required item on the displayed menu. The action selected on the menu is applied to all of the selected threats.

Note that

- If a threat is detected in a complex object (archive, email message, etc.), the selected action is applied to the container as a whole (and not to only the infected object);
- The **Cure** action can be applied not to all threat types;
- If a file contains only malicious content and has no useful content, effect of the **Cure** action is equal to the **Delete** action.

If required, [elevate application privileges](#) to enable successful neutralization of threats.

Viewing information on threats

For details on a detected threat, right-click the item with information on the threat and then click **Details** on the displayed menu. After that, a window opens that contains detailed information on the threat and objects that contained the threat. To view information on multiple threats at a time, select the required items with a mouse button while holding down a CTRL key.

Picture 34. Information on a threat

In this window, the following information is available:

- Name of the threat (according to the **Doctor Web** classification)
- Name of the **Dr.Web for Linux** component which detected the threat
- Date and time of the detection
- Information on the file system object where the threat was detected: object name, owner, date of the latest modification and path to the object in the file system
- Last action applied to the threat and the result (if an option to apply actions to threat automatically is enabled for the component)

Clicking a threat name link opens a webpage with information on the threat in your browser (a threat name is a link to the official **Doctor Web** website; a valid Internet connection is required). You can also save the displayed information by clicking **Export** (once you click the button, a window where you

can select a file for saving opens).

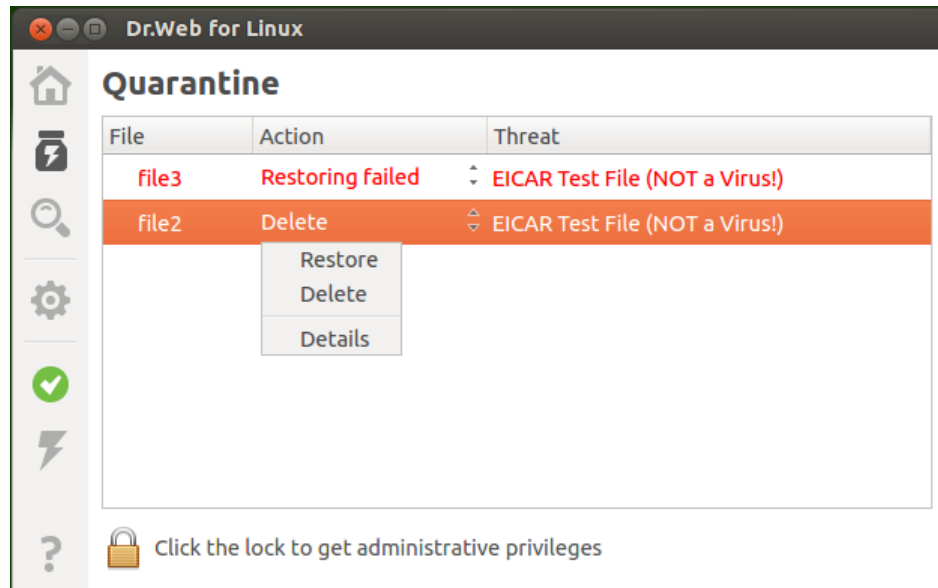

To close the window with details on a threat and infected object, click **Close**.

Managing Quarantine

The list of files moved to quarantine by **Dr.Web for Linux** components displays on a special window page.

To open the page where you can manage quarantine, click the button on the [navigation pane](#).

Picture 35. Quarantine management page

If quarantine is not empty, the following information displays for each detected threat:

- Name of the infected object
- Action to be applied to the quarantined object
- Name of the [threat](#) (according to the **Doctor Web** classification)

Applying actions to isolated objects

To apply an action to the quarantined object, right-click the line with information on the isolated object and select the required action on the displayed menu. To apply an action to multiple objects, select them with the mouse button holding down a CTRL or SHIFT keys.

- When you hold down a CTRL key, isolated objects are selected by ones.
- When you hold down a SHIFT key, isolated objects are selected contiguously.

The following actions are available for isolated objects:

- **Restore** – restore the isolated object to its original location
- **Delete** – permanently delete the object

If the selected action is successfully applied to the object, its record is deleted from the table. If an attempt to apply an action fails, the item in the quarantined object list is displayed red and an error message appears in the **Action** field.

If required, [elevate application privileges](#) to enable successful neutralization of threats.

Viewing information on isolated objects

For details on an isolated object, right-click in the line with information on the object and then click **Details** on the displayed menu. After that, a window opens that contains detailed information on the quarantined object. To view information on multiple objects at a time, select the required items with a mouse button while holding a CTRL key.

Picture 36. Information on a quarantined object

The window displays the following information:

- Threat name (according to **Doctor Web** classification)
- Date and time of moving the object to quarantine
- [Type](#) of the quarantine directory where the object was moved
- Last action applied to the object and the action result
- Name of the **Dr.Web for Linux** component which detected the threat
- Details on the isolated object: object name, owner name, last modified date and path to the object in the file system

Clicking a threat name link opens a webpage with information on the threat in your browser (a threat name is a link to the official **Doctor Web** website; a valid Internet connection is required). You can save the displayed information to the text file by clicking the **Export...** button (once the button is clicked, a file chooser window opens).

To close the window with detailed information on the object, click **Close**.

Updating Virus Databases

Periodic updates to virus databases and **Anti-virus** engine are downloaded and installed by **Updater** automatically. You can view status of virus databases and force a database update on a special page of

the **Anti-virus** window. To open the page, click **Update** on the [Main page](#) or click  on the navigation pane (the button is visible only if the update management page was already opened from the Main page).

Picture 37. Update management page

The page displays the following information:

- Virus database status
- Information on the last update and time of the next scheduled update

To force a database update, click **Update**. To close the update management page, click **Close**.

If **Dr.Web for Linux** is operating in [Central protection](#) mode and the central protection server disabled manual updates according to the security policy of the anti-virus network, the update management page can be blocked.

Configuring updates

You can configure **Dr.Web for Linux** update settings on the [Settings page](#) on the **Main** tab.

Updater issues

If **Updater** failure is detected, error information is displayed on the update management page. To resolve the problem, refer to [Appendix D](#), where you can find detailed description of known errors.

License Manager

In graphics mode, **License manager** allows to view information on the current license issued for the **Dr.Web for Linux** user. License data is stored in a license key file that provides operation of **Anti-virus** on the user computer. If neither license key file nor demo key file is found on the computer, all **Dr.Web for Linux** functions (including file check, file system monitoring, virus database update) are blocked.

License manager

License Manager page is available in the **Dr.Web for Linux** graphical interface. To open the License

manager page, click the **License** button on the [Main page](#) or click  on the navigation pane (the button is visible only if the **License manager** page is already open from the Main page).

If a demo key file or license key file for **Dr.Web for Linux** to use is found, the **License Manager** start page displays license information including license number, license owner, and duration period. This information is retrieved from the corresponding key file.

The picture below shows appearance of the **License Manager** page.

Picture 38. License information page

To delete a license key file, click the cross icon next to the license number.

You can close **License Manager** at any stage by clicking the **Close** button at the bottom of the window. Once the button is clicked, the Main page of the **Dr.Web for Linux** opens.

License activation

To activate a license via **License Manager** and obtain the corresponding key file providing functionality of **Dr.Web for Linux** (which includes purchasing a new license or renewing the current one) or obtain a demo license, click **Activate license**. After that, the registration wizard opens. Note that the registration wizard also opens automatically when **Anti-virus** is first started after its installation.

On the first step, select the activation type which can be one of the following:

1. Activation of license or demo period using a serial number
2. Obtaining a demo period
3. Installation of a key file obtained earlier
4. Activation of **Anti-virus** via the central protection server

To register a serial number and obtain a demo key file, a valid Internet connection is required.

1) Activation of license or demo period using a serial number

To activate a license or demo period using a serial number, select the **Activate license** item on the first step of the registration procedure. After that, enter the serial number in the four-segmented box and click **Next**.

Picture 39. Registration using a serial number

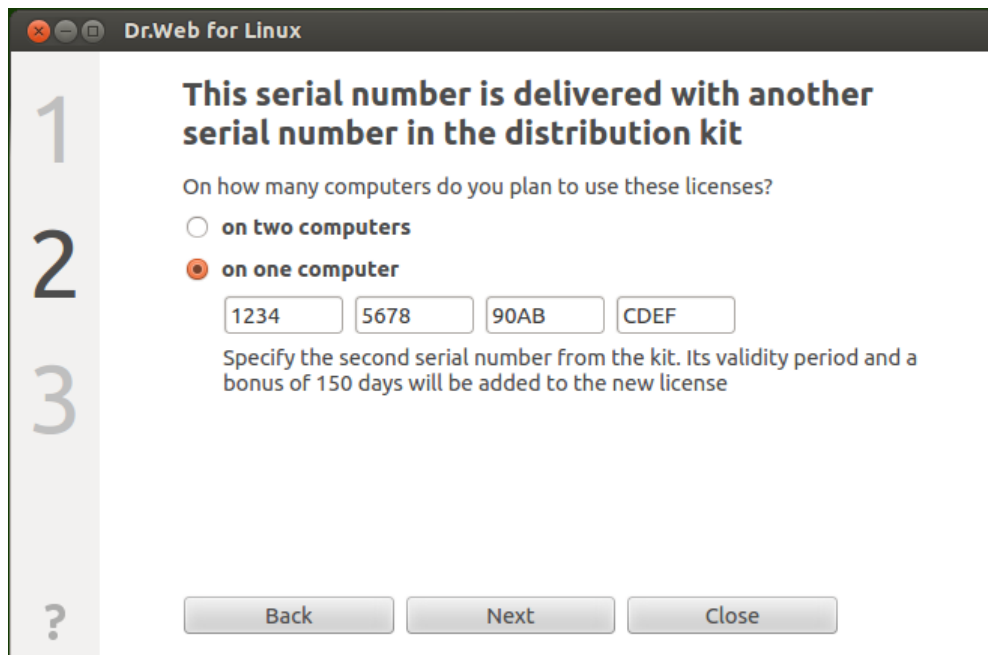

If you do not have a serial number or a valid key file, you can purchase license on the **Doctor Web** official website. To open the online store page, click **Purchase license**.

For information on other ways to purchase the license for **Dr.Web** products, refer to the [Licensing](#) section.

Once you click the **Next** button, connection to the **Doctor Web** registration server is established.

If the serial number, which you specified on the first step, was obtained from the **Doctor Web** website and issued for a three month's demo period, further steps are not required for its activation.

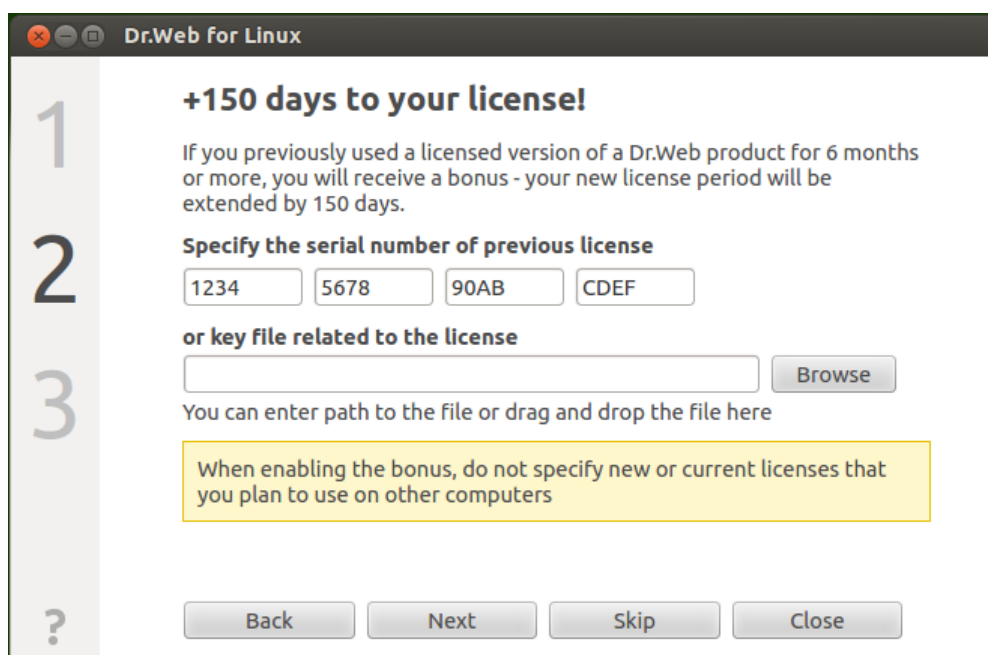

If the specified serial number corresponds to the license for using **Dr.Web for Linux** on two computers, you need to select on how many computers you would like to use the product. If you select **on two computers**, you can activate the second serial number on another computer and receive the second license key file. At that, the licenses are valid for the same period (for example, for one year). If you select **on one computer**, specify the second serial number in the appeared four-segmented box. In this case, you cannot register this serial number later on another computer (as well as use a copy of the license key file resulting from activation of a combined license), but the duration of the current license is doubled (for example, extended to two years if the license period is one year).

Picture 40. Selecting the number of computers

After you select the number of computers on which you would like to activate the license, click **Next**.

On this step, you are prompted to receive a bonus and extend the license period for 150 days. To enable the bonus, specify the previously purchased license if any.

Picture 41. License renewal

If you specify a license which is not expired, the activated license period will be extended by the remaining period of the previous license and by the bonus of 150 days. You can skip this step (by clicking **Skip**), but in this case the remaining period of the previous license will be lost and the bonus will not be enabled. If you activate a license with two serial numbers, the bonus period will be processed depending on the option you specified at the previous step.

- **On two computers**, and this computer is the first one. To enable the bonus of 150 days for

the first computer, specify the serial number of the previous license issued for this computer (if any). Do not specify the second serial number of the previous license here.

- **On two computers**, and this computer is the second one. To enable the bonus of 150 days for the second computer, specify either the serial number of the previous license issued for this computer (if any), or the serial number of the previous license issued for the first computer (if any).
- **On one computer**. In this case, not only the duration of the purchased license is doubled, but also the license period is extended for 150 days. Moreover, if you specify the previous license issued for the second computer, the doubled period of the new license will be extended by another 150 days (and by the remaining period of the previous license).

If you activate a special *renewal license* and click **Skip** at this step, the remaining period of the previous license will be lost and the validity period of the new license will be reduced by 150 days.

To specify the previous license, you can either enter its serial number in the corresponding box or specify its key file. To specify the key file, do one of the following:

- Specify the file path in the entry field
- Specify the file via the standard file chooser by clicking the **Browse** button
- Drag and drop the file from the file manager window to the window of the Registration wizard

Note that you can specify the zip archive containing the key file without unpacking it.

To continue the registration, click **Next**.

On the next step, specify personal data including the following:

- Registration name
- Your region (country), which is selected from the list
- Correct email address

All registration form fields are mandatory. Moreover, you can subscribe to **Doctor Web** newsletters (news emails are sent to the email address specified during the registration procedure) by selecting the corresponding check box.

Picture 42. User information page

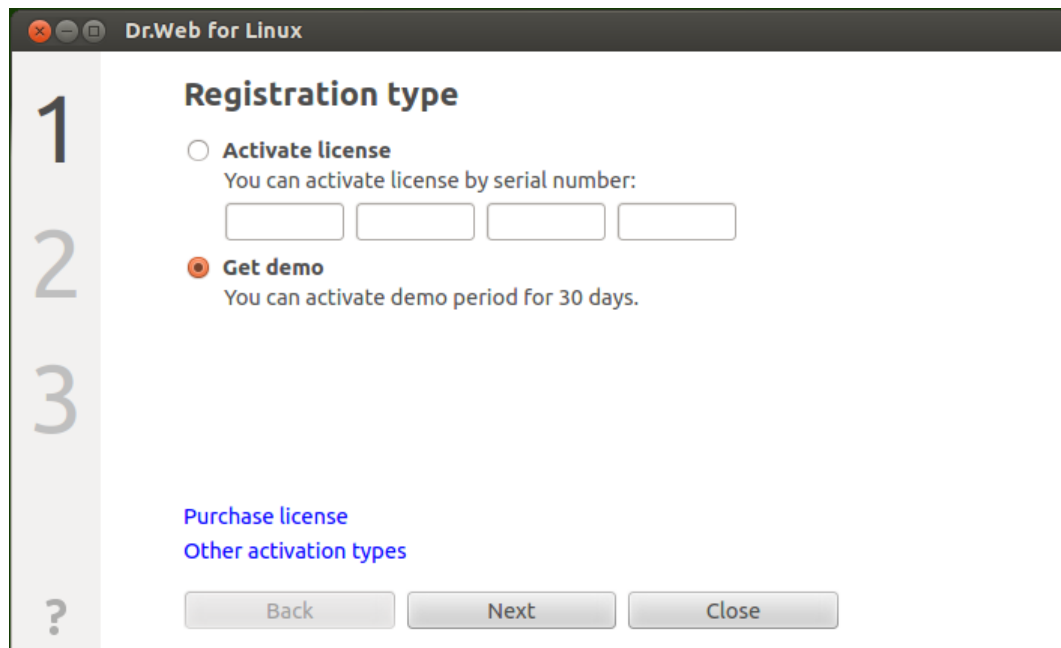

For **Doctor Web** privacy policy applied to personal user information, click the **Privacy statement by Doctor Web** link available on this page of the registration wizard (the webpage with the statement opens in your browser).

After all fields are filled in correctly, click the **Next** button to establish a server connection and obtain a license key file (note that clicking the button to continue registration means that you accept the privacy policy of **Doctor Web** applied to user personal information). If necessary, you can use the license key file on another computer after you remove it from this computer.

2) Obtaining a demo period

If you would like to activate a demo period that provides full functionality of **Dr.Web for Linux** components for a period of 30 days, select the **Get demo** item and click **Next**.

Picture 43. Obtaining a demo key file

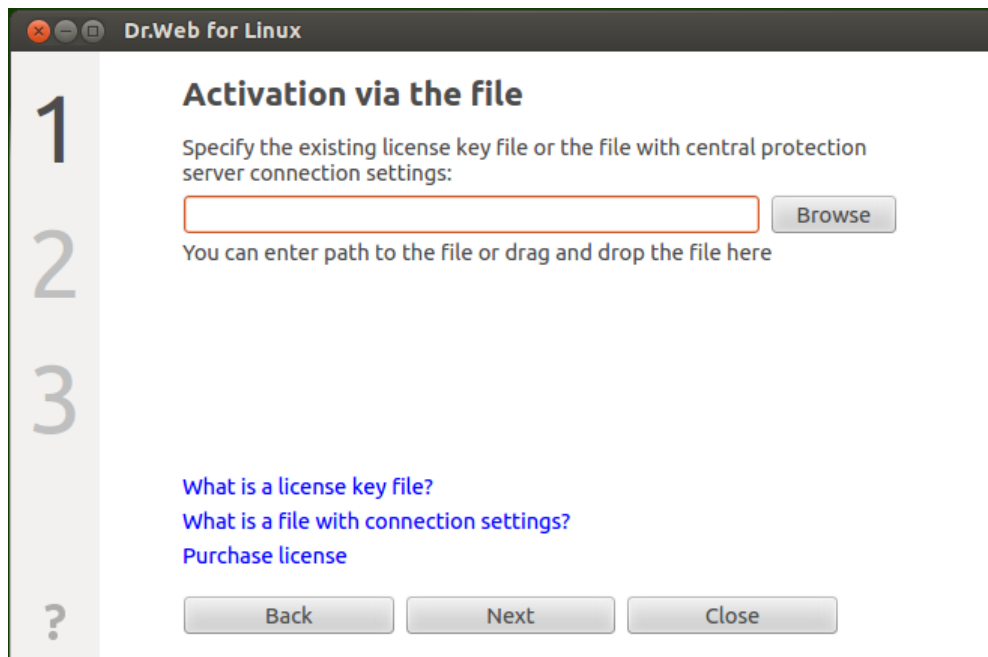

When activating a demo period for 1 month, you do not need to provide your personal data. However, you can register on the official **Doctor Web** website and obtain a serial number for three month's demo period. Another demo period for the same computer can be obtained after a certain time period.

For details, refer to the [Licensing](#) section.

3) Installation of a key file obtained earlier

If you already have a valid license and the related key file (for example, obtained from **Doctor Web** or **Doctor Web** partners via email), you can activate **Dr.Web for Linux** by installing this key file. For that purpose, click **Other activation types** on the first step and specify the key file path in the displayed box and click **Next**.

Picture 44. Activation using the key file

To specify the key file, do one of the following:

- Specify the file path in the entry field
- Specify the file via the standard file chooser by clicking the **Browse** button
- Drag and drop the file from the file manager window to the window of the Registration wizard

Note that you can specify the zip archive containing the key file without unpacking it.

After you specify the key file path (or the path to the archive containing the key file), click **Next** to install the key file automatically. If required, the key file is automatically unpacked and copied to the directory with **Anti-virus** files. An Internet connection is not required.

4) Activation of Anti-virus via the central protection server

You can activate your **Anti-virus** by connecting it to the central protection server which allows for central administration of the anti-virus network. In this case, the server generates a key file required for **Anti-virus** operation. Choose this activation type only if the provider or corporate network administrator delivered a special file which stores settings for connection of your **Anti-virus** to the central protection server.

To connect **Anti-virus** to the central protection server, click **Other activation types** on the first step, specify the path to the settings file and click **Next**.

Picture 45. Activation using the settings file

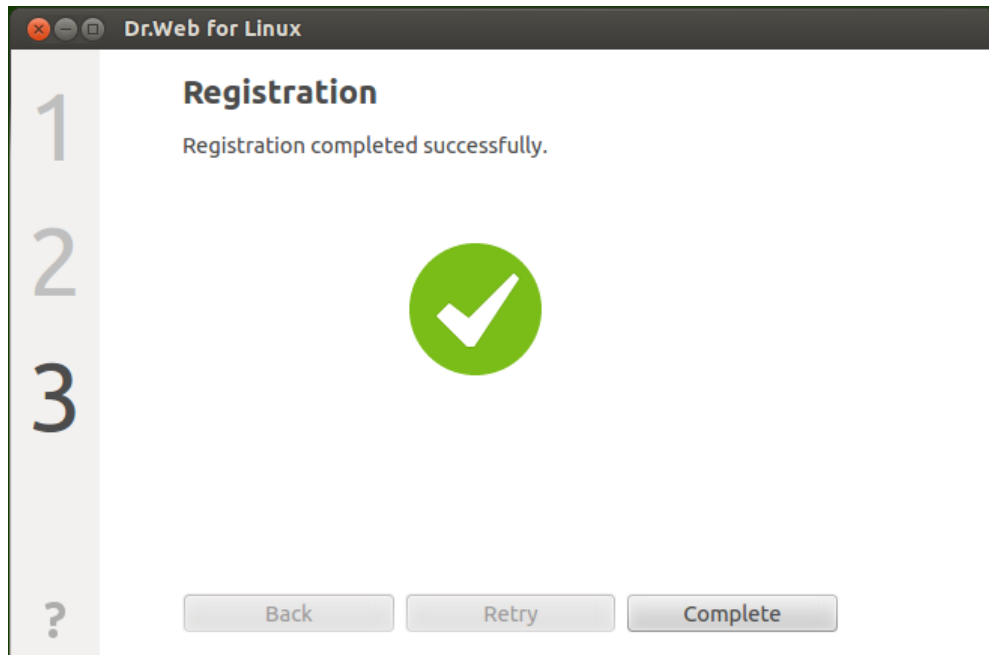

To specify the key file, do one of the following:

- Specify the file path in the entry field
- Specify the file via the standard file chooser by clicking the **Browse** button
- Drag and drop the file from the file manager window to the window of the Registration wizard

Note that you can specify the zip archive containing the key file without unpacking it.

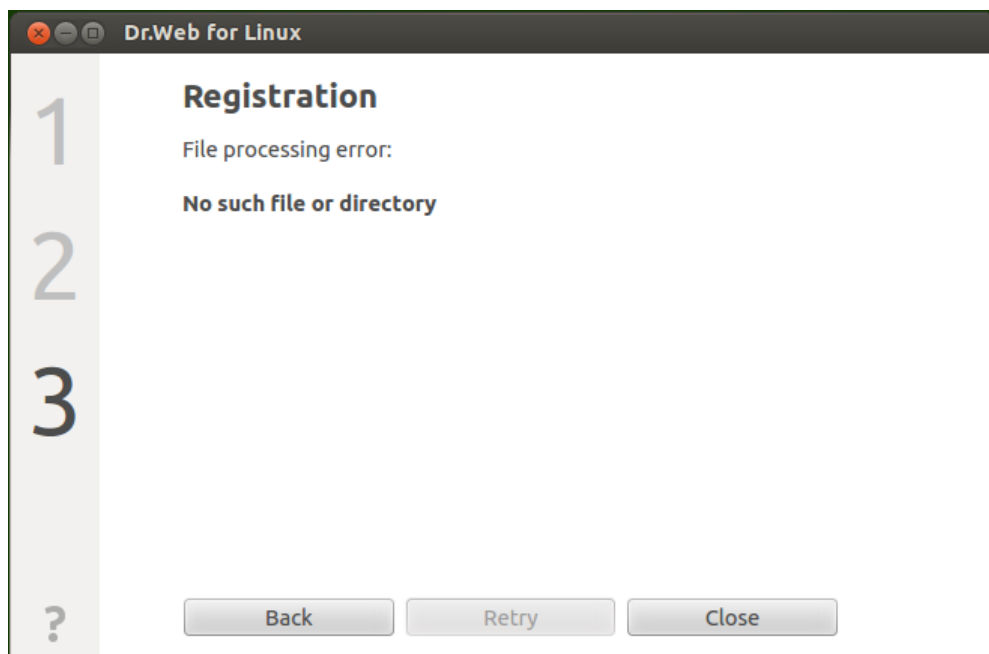

After you specify the path to the settings file (or the archive containing this file) click **Next** to establish connection to the central protection server (a network connection is required).

After the registration procedure completes (regardless of the selected activation type), the final page of the wizard with the corresponding notification displays. Click **Complete** to exit the wizard and open the [Main page](#) of the **Dr.Web for Linux**.

Picture 46. Successful registration notification

If an error occurs on any step of the procedure, a page with the corresponding notification and short error description is displayed. The picture below shows an example of such a page.

Picture 47. Error message

If an error occurs, you can return to the previous step and make corrections (for example, correct the serial number or specify the correct file path). To return to the previous step, click **Back**. If the error is caused due to a temporary problem (for example, temporary network failure), you can attempt to retry the operation by clicking **Retry**. If necessary, you can click **Close** to cancel the registration and exit the wizard. In this case, you need to retry the registration procedure later.

You can access the reference materials on any step by clicking . Moreover, some pages contain links to additional information.

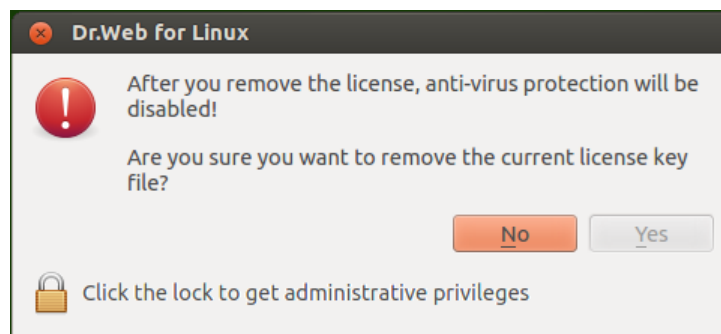

Note that upon activation of a new license and generation of a new [key file](#), the previous key file, used by **Anti-virus**, is automatically saved as a backup copy to the `/etc/opt/drweb.com` directory. If required, you can enable use of this key file again by [installing](#) it.

Deleting license key file

If necessary (for example, if you decided to use **Dr.Web for Linux** on another computer), you can delete an installed license key file that manages **Anti-virus** operation. For that purpose, open the page with [license information](#) (the start page of **License manager**) and click the cross icon next to the number of the current license.

After that, confirm deletion of the license key file in the appeared window by clicking **Yes**. If you want to cancel the deletion, click **No**.

Picture 48. Confirmation dialog before deleting a license key file

To delete a license key file, the application must be started with superuser privileges. If the application does not have elevated permissions, the **Yes** button is unavailable on attempt to delete a key file. If required, you can [elevate the privileges](#) and, if the elevation succeeds, the **Yes** button becomes available.

Deletion of a license key file does not affect the license validity period. If the license is not expired, you can obtain a new key file for this license for the remaining period.

After a license key file is deleted, all anti-virus functions of **Dr.Web for Linux** ([file scanning](#), virus database [updating](#), file system [monitoring](#)) are blocked until a new license or demo period is activated.

Managing Application Privileges

Some operations with **Dr.Web for Linux** can be performed in graphics mode only if the application has elevated privileges (*administrative privileges*) that correspond to the superuser permissions. Among such actions are the following:

1. [Management of objects](#) moved to the *system quarantine* (that is, to the non-user quarantine [directory](#))
2. [Check](#) of files and directories of other users (in particular, of superuser)
3. [Disable SpIDer Guard](#)
4. [Disable SpIDer Gate](#)
5. [Removal](#) of a license key file, [connection and disconnection](#) from the central protection server

Even if the application is started by the superuser (for example, by using `su` or `sudo` commands), it **is not** granted elevated privileges by default.

All pages that provide for actions requiring elevated privileges contain a special button with a lock icon. The icon indicates whether or not the application has superuser privileges:

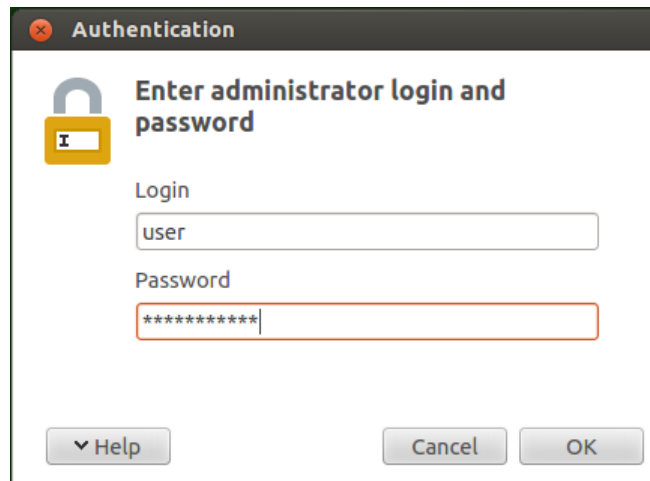

- Application does not have elevated privileges.
Click the icon to elevate the privileges.

- Application has elevated privileges.
Click the icon to lower the privileges; that is, to switch from administrative privileges to user rights.

Once you click the icon for privilege elevation, the user authentication window opens.

Picture 49. Authentication window

To grant the application administrative privileges, you need to authenticate as a user whose account is included in administrator group of **Anti-virus**, or as a superuser (system account `root`) and click **OK**. To cancel the privilege elevation, click **Cancel**. Clicking the **Help** button displays a short help text describing how to authenticate. To hide the text, click the **Help** button again.

During **Anti-virus** installation, a group containing users who can elevate their rights to superuser privileges (such as `sudo` group) is automatically registered as the administrators group. If such user group cannot be detected, use the login and password of the superuser to elevate application privileges.

Switching from administrative privileges to user rights does not require authentication.

Help and Reference

To access the Help file, click  on the [navigation pane](#).

Once you click the button, a pop-up menu with the following items appears:

- **Help** – opens the **Dr.Web for Linux** User manual
- **Forum** – opens the webpage of the **Doctor Web** official forum (requires a valid Internet connection)
- **Technical support** – opens the **Doctor Web** technical support webpage (requires a valid Internet connection)
- **My Dr.Web** – opens your personal webpage on the **Doctor Web** official website (requires a valid Internet connection)

- **About** – opens a window showing information about your version of **Dr.Web for Linux**

Besides, when any page of the **Anti-virus** main window displays an error message, you can follow the **Details** link to get information on the error and instructions to resolve the problem.

Configuring Operation Settings

On the settings page, you can configure the following application parameters:

- Update period
- Actions applied to detected threats (detected both by **Scanner** during [scanning started on demand](#) and by **SpIDer Guard**)
- List of objects to be excluded from **Scanner** and **SpIDer Guard** checks
- Parameters of Internet access monitoring
- Schedule to run periodic checks by **Scanner**
- Protection mode (*Standalone, Central protection*)

To open the settings page, click  on the [navigation pane](#).

On the settings page, the following tabs are available:

- [Main](#) – on this tab, you can configure notification settings and frequency of automatic updates.
- [Scanner](#) – on this tab, you can configure **Anti-virus** reaction to threats detected during scanning on demand or as scheduled.
- [SpIDer Guard](#) – on this tab, you can configure **Anti-virus** reaction to threats detected by **SpIDer Guard**.
- [SpIDer Gate](#) – on this tab, you can configure parameters of Internet access monitoring performed by **SpIDer Gate**.
- [Exclusions](#) – on this tab, you can adjust the list of objects to be excluded from [scanning](#) on demand, from scanning started according to the schedule, or from **SpIDer Guard** checks.
- [Scheduler](#) – on this tab, you can configure the schedule to start scanning.
- [Mode](#) – on this tab, you can select the [operation mode](#) of **Dr.Web for Linux** (Standalone, Central protection).

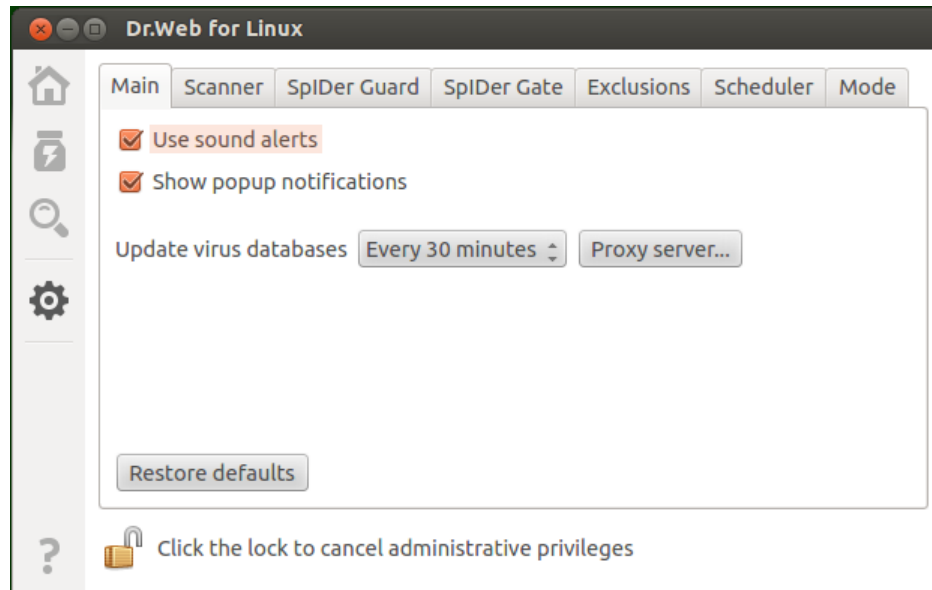

All changes specified on these tabs are applied immediately.

Note that when **Dr.Web for Linux** is operating in [Central protection](#) mode, some of the settings can be unavailable.

Main Settings

On the **Main** tab, you can configure main application settings.

Picture 50. Main tab

Option	Description
Use sound alerts	Select this check box if you want Anti-virus to use sound notifications on particular events, such as <ul style="list-style-type: none">• Detection of a threat (by both Scanner and SpIDer Guard)• Scan error• Others
Show popup notifications	Select this check box if you want Anti-virus to show pop-up notifications on particular events, such as <ul style="list-style-type: none">• Threat detection• Scan error• Others
Update virus databases	Select the frequency at which availability of updates to virus databases and to Anti-virus engine is checked by Updater .
Proxy server	Click to configure proxy server settings for receiving updates (Updater uses a proxy server if contact to external servers is prevented by the network security policy).
Restore defaults	Click to restore default settings.

To manage update settings and restore defaults, the application must have superuser privileges. For details, refer to the [Managing Application Privileges](#) section.

Configuring Proxy Server for Updates

In the window with settings that configure how **Updater** uses a proxy server, you can

- Enable or disable use of the proxy server for receiving updates.
- Specify address of the proxy sever used for receiving updates.
- Specify the port to connect to the proxy server.

- Specify the user name and password used for authentication on the proxy server.

A dialog box titled "Use proxy server" with a checked checkbox. It contains fields for "Server address" (192.168.0.1), "Port" (2345), "Login" (user), and "Password" (masked with asterisks). There are "Cancel" and "Ok" buttons at the bottom.

Picture 51. Proxy server settings

Click **OK** to save the changes and close the page or **Cancel** to reject them.

Scanner Settings

On the **Scanner** tab, you can specify actions that **Dr.Web for Linux** applies to threats detected when scanning files [on user demand](#) or as [scheduled](#).

The "Dr.Web for Linux" application window with the "Scanner" tab selected. It shows a list of actions for different threat types: Infected objects (Cure), Incurable objects (Move to quarantine), Suspicious objects (Move to quarantine), and a section for "Other" threats including Adware, Dialers, Jokes, Riskware, and Hacktools (all with "Move to quarantine" or "Ignore" actions). There is a checked checkbox for "Automatically apply actions to threats" and an "Advanced..." button.

Picture 52. Scanner settings tab

In the drop-down lists select an [action](#) to be applied by **Dr.Web for Linux** to a threat of a [particular type](#).

If you want **Anti-virus** to apply specified actions to malicious objects immediately upon threat detection, select the **Automatically apply actions to threats** check box. In this case, the user is notified on a neutralization event and information on the neutralized threat is added to the [threat list](#)). If the check box is not set, **Scanner** adds a detected threat to the list and the user manually selects an

action to be applied.

To ensure the highest security, it is recommended to select those reactions to threats that are indicated as recommended in the list and enable the **Automatically apply actions to threats** option.

To open a window with advanced scan settings, click the **Advanced** button.

Advanced scan settings

In the window with advanced settings, you can configure parameters of **Scanner** operation, such as:

- Enable or disable scan contents of containers
 - Archives
 - Email files
- Set maximum time to scan one file.

Picture 53. Advanced scan settings

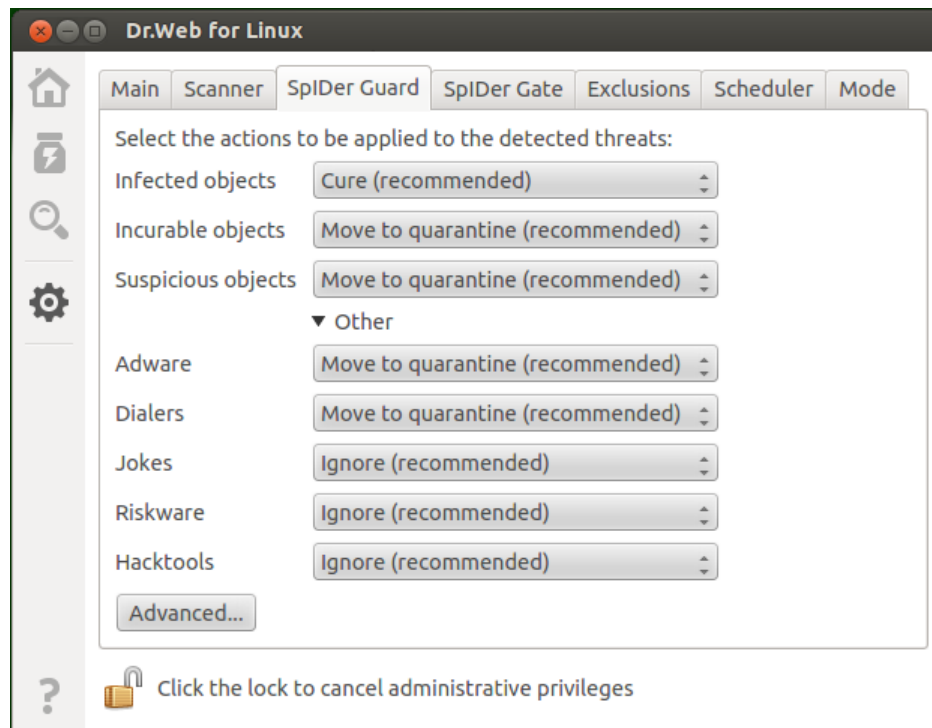

If check boxes are not selected, containers also will be scanned, but only as whole objects, that is, without analysis of their internal structure.

Click **OK** to save the changes and close the window or **Cancel** to reject them.

SpIDer Guard Settings

On the **SpIDer Guard** tab, you can specify actions applied to threats detected by **SpIDer Guard**.

Picture 54. SpIDer Guard settings tab

The options available on this tab are similar to those on the [Scanner](#) tab.

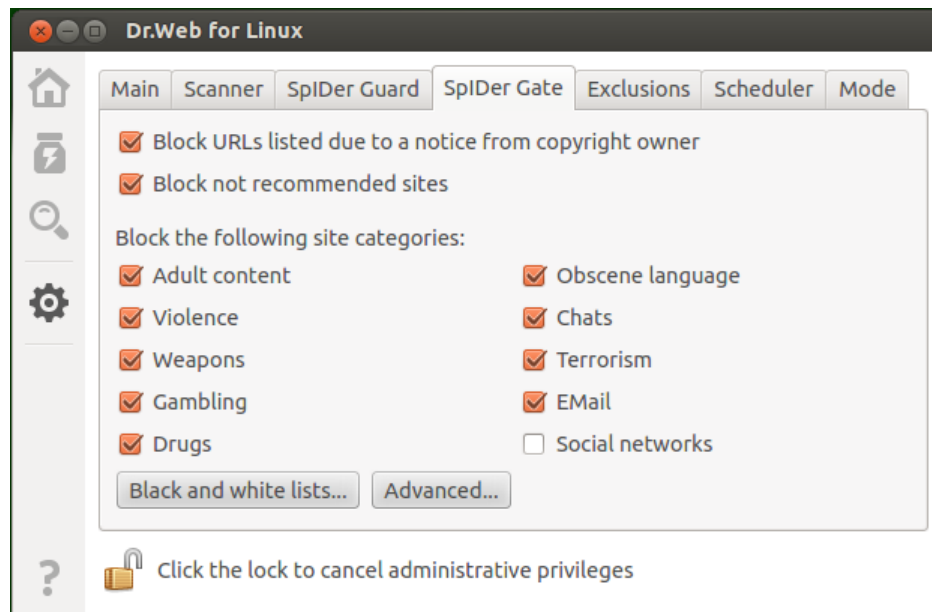

Adjustment of **SpIDer Guard** settings requires the application to have elevated privileges. For details, refer to the [Application Rights Management](#) section.

If **Anti-virus** is operating in [Central protection](#) mode, these settings are enabled in dependence on permissions are specified on the server.

SpIDer Gate Settings

On the **SpIDer Gate** tab, you can configure security policies for **SpIDer Gate** to use when monitoring Internet access.

**Picture 55. SpIDer Gate settings tab**

By selecting or clearing the options, you can enable or disable access to websites of the following categories:

Category	Description
<i>URLs listed due to a notice from copyright owner</i>	Websites with content which infringes copyright (according to the copyright holder of published material), for example, file reference directories, file hosting services.
<i>Not recommended sites</i>	Websites with unreliable content (suspected of phishing, password theft, etc.).
<i>Adult content</i>	Websites with adult content
<i>Violence</i>	Websites that contain violent material (for example, acts of terrorism, war scenes).
<i>Weapons</i>	Websites that contain information on weapons and explosives.
<i>Gambling</i>	Internet casinos, gambling and bookmaking websites.
<i>Drugs</i>	Websites that contain information on drug production, distribution, and use.
<i>Obscene language</i>	Websites with obscene language.
<i>Chats</i>	Chat websites.
<i>Terrorism</i>	Websites that contain detailed description of terrorist acts, manufacture of explosives, terrorist propaganda materials.
<i>EMail</i>	Websites that offer free email registration.
<i>Social networks</i>	Social networking websites.

Lists of URLs that fall into these categories are provided with **Anti-virus** and are updated automatically upon virus database update. Users do not have permissions to edit the lists.

The same website can fall into several categories. If so, **SpIDer Gate** blocks access to it if the URL is included at least in one of the selected lists.

If you need to block access to an website which does not fall into any of these categories, add it to the

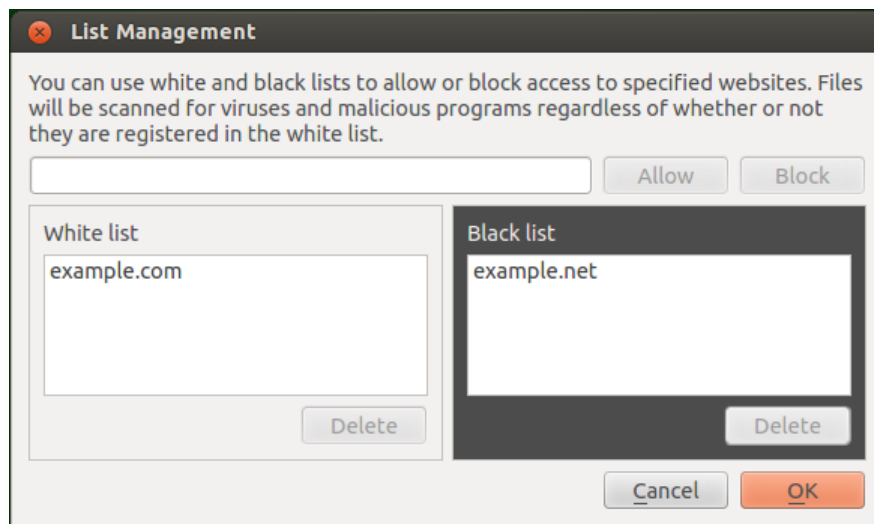

user black list. If, alternatively, you need to allow access to a blocked website which is included in one of the above mentioned black lists, add it to the user white list.

There is also a special category of websites – malicious (malware) websites. Access to them is always blocked, even if such resources are added to the user white list.

Managing black and white lists of websites

To configure user black and white lists, click the **Black and white lists** button.

Picture 56. Black and white lists management

To add a website to a black or white list, enter its domain address in the text box and click the corresponding button.

- Click **Allow** to add the specified address to the white list.
- Click **Block** to add the specified address to the black list.

Adding a domain address to the white or black list respectively allows or blocks access to all the resources within this domain.

To remove an item from one of the lists, select it and click **Delete**.

To apply the changes and close the window, click **OK**. To discard the changes and close the window, click **Cancel**.

Configuring file scanning parameters

To configure parameters for **SpIDer Gate** to use when checking downloaded files, click **Advanced**.

Picture 57. Configuring file check settings

In the open window, you can specify categories of malicious objects to be blocked on attempt to download them from the Internet. If a check box is selected, files that fall into this category are rejected. If a check box is cleared, files that fall into this category are allowed for downloading. Also you can set the maximum time to scan one downloaded file. If the option to **Block unchecked files** is selected, files that were not checked due to an error are blocked and cannot be downloaded. To allow download of such files, clear this check box (not recommended).

If downloaded file scanning failed because the interval for performing this operation expired, such file will not be treated as unchecked and will not be blocked even if the **Block unchecked files** check box is checked.

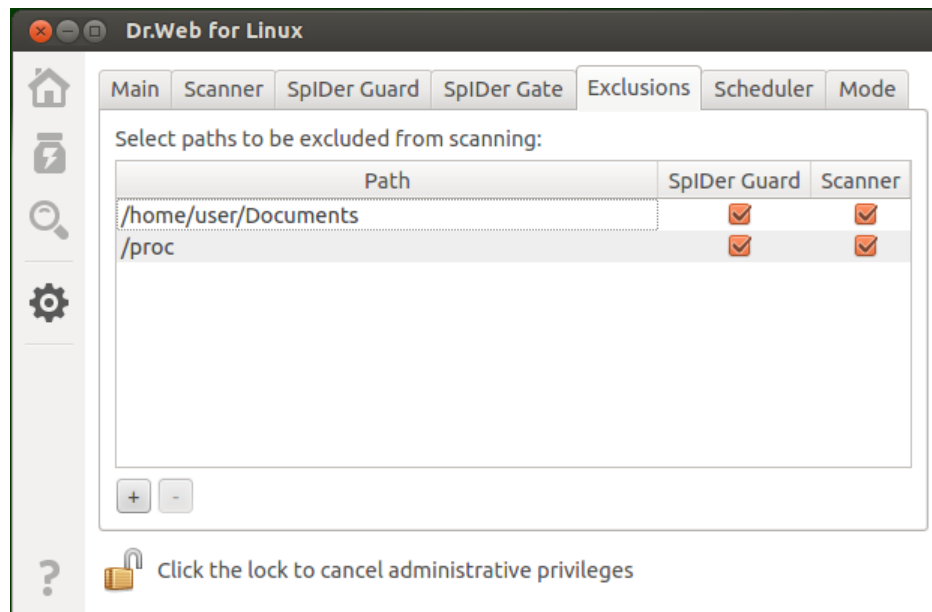

To apply the changes and close the window, click **OK**. To discard the changes and close the window, click **Cancel**.

To configure Internet access monitoring settings, the application must have elevated privileges. For details, refer to [Managing Application Privileges](#).

Exclusions

On the **Exclusions** tab, you can specify paths to objects that you would like to exclude from scanning [on user demand](#) and/or as [scheduled](#), as well as adjust list of exclusions from [SpIDer Guard checks](#).

Picture 58. Exclusions tab

You can add the same object to both lists of exclusions and disable its checks by **Scanner** (on demand and as scheduled) and by **SpIDer Guard**. If an object is added to an exclusion list, it is indicated with a flag in the corresponding column.

Adding and removing objects from exclusion lists

To exclude a listed object from **Scanner** or **SpIDer Guard** checks, select the respective check box in the object string. To remove an object from the exclusion list and enable object checks again, clear the corresponding check box in the object string.

To add a new object path to the list presented in this window, click the "+" button below the listed paths and select the new object in the appeared window. Besides that, you can add paths by dragging and dropping objects from the File Manager window.

To remove an object path from the list, select the object string and click the "-" button below the listed paths.

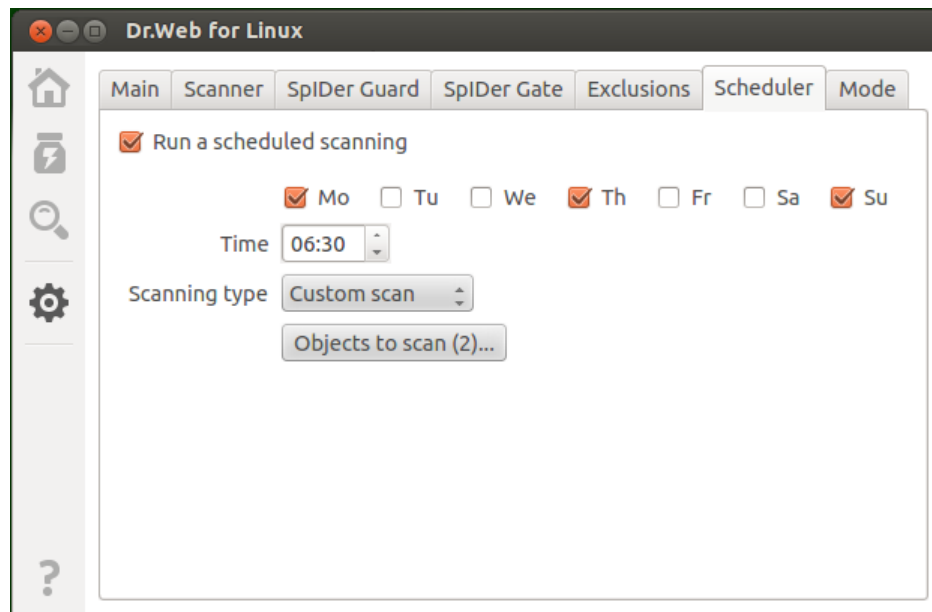

Adding or removing an object from the exclusion list of **SpIDer Guard** requires the application to have elevated privileges. For details, refer to the [Managing Application Privileges](#) section.

Note that an object path cannot be removed if the object is added to the **SpIDer Guard** exclusion list and the application does not have permissions to adjust it.

Scheduler Settings

On the **Scheduler** tab, you can enable an option to scan objects automatically according to the schedule as well as specify this schedule and select the scanning type.

Picture 59. Scheduler tab

To enable automatic scheduled scans, select the **Execute a scheduled scanning** check box. In this case, **Dr.Web for Linux** creates a task for the **cron** job scheduler to periodically start scanning.

The **cron** job scheduler starts scanning at the specified intervals regardless of whether **Anti-virus** is started or not.

If **Anti-virus** is operating in [Central protection](#) mode and launch of scanning by user demand is prohibited on the central protection server, **Scanner** will not launch scanning tasks even if they are scheduled.

Scanning started according to the schedule as well as scanning [on demand](#) is configured with the settings specified on the **Scanner** [tab](#).

Configuring scheduled scanning

If scheduled scanning is enabled, you can configure the following parameters:

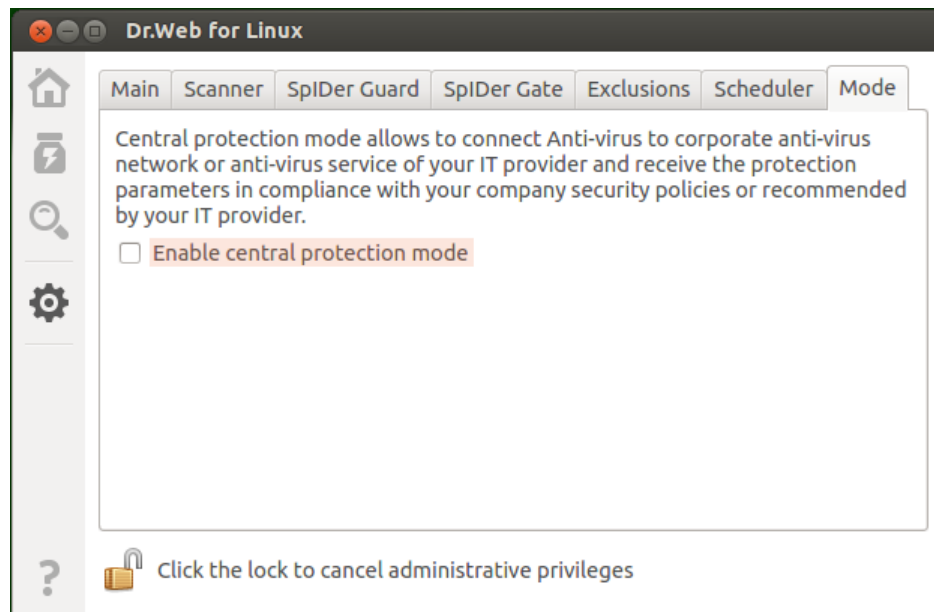

- Days of week when scanning is to be started (by selecting the corresponding check boxes)
- Time (hours and minutes) when scanning is to be started
- [Scan type](#) (*Fast*, *Full*, or *Custom*)
- If you select *Custom scan* type, you can specify the list of objects to be scanned. For that purpose, click the **Objects to scan** button (number of selected objects is indicated within the brackets).

After that, select the necessary object in the appeared window which is similar to the [file chooser](#) for custom scanning on demand. You can add objects to the list either by clicking the "+" button or by dragging and dropping them from the File manager window.

To disable scheduled scanning, clear the **Execute a scheduled scanning** check box. The respective task is automatically removed from the **cron** task list.

Mode Settings

On the **Mode** tab, you can connect **Dr.Web for Linux** to the central protection server (by enabling Central protection mode) as well as disconnect from the central protection server (if so, **Dr.Web for Linux** is operating in Standalone mode).

**Picture 60. Mode tab**

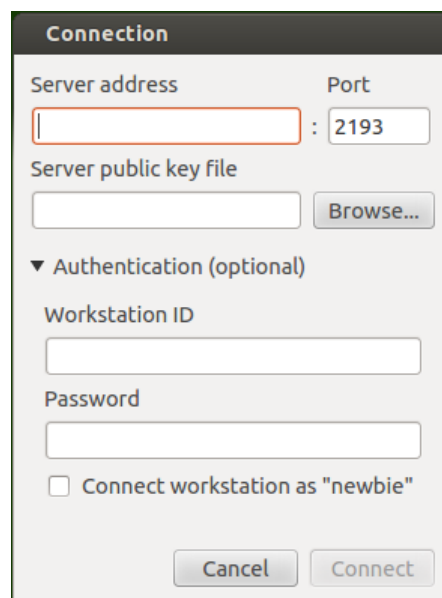

To connect **Dr.Web for Linux** to the central protection server or disconnect from that, use the corresponding check box.

To connect **Dr.Web for Linux** to the central protection server or disconnect from it, the application must have elevated privileges. For details, refer to the [Managing Application Privileges](#) section.

Connecting to central protection server

On attempt to establish connection to the central protection server, a window with connection parameters appears.

**Picture 61. Server connection dialog**

To establish connection to the central protection server, specify the following parameters (provided by your network administrator or Internet service provider):

- Address of the central protection server

- Port used when connecting to the central protection server
- Path to the file with the server public key

Moreover, you can enter the identifier and password for the workstation to authenticate on the server (if known). Authentication will succeed only if the correct pair of identifier/password values is specified. If the fields are empty, connection will be established only when approved on the server (automatically or by the anti-virus network administrator, depending on server settings).

You can also select the **Connect workstation as "newbie"** check box. If allowed on the server, a unique login/password pair will be automatically generated after the connection is approved. Note that if this check box is selected, a new pair of values is generated even if the workstation already has an account on the server.

To connect to the server, specify all of the parameters, click **Connect** and wait for connection to be established. To close the window without establishing a server connection, click **Cancel**.

After you connected **Dr.Web for Linux** to the central protection server, **Anti-virus** is administered by the server until they are disconnected. In Central protection mode, a server connection is automatically established on every operating system startup. For details, refer to the [Operation modes](#) section.

Please note that in case if launching of scanning by user demand is prohibited on used central protection server, the [Scan](#) page of the **Anti-virus** window will be disabled. Moreover, in this case **Scanner** will not launch scanning tasks even if they are [scheduled](#).

Advanced

Command Line Parameters

To start **Dr.Web for Linux** in graphics mode from the command line, the following command is used:

```
$ drweb-gui [options]
```

You can specify the following command options:

Short case	Full case	Arguments
-h	--help	
<u>Description:</u> Show information about supported command-line parameters and exit		
-v	--version	
<u>Description:</u> Show information on the module version and exit		
-d	--debug	
<u>Description:</u> Enable output of debug information when application is running.		

Example

```
$ drweb-gui --debug
```

This command starts **Dr.Web for Linux** in graphics mode with enabled option to output debug information.

Working from Command Line

You can manage operation of **Dr.Web for Linux** from the command line with the help of a special command-line tool - **drweb-ctl**.

You can do the following actions from the command line:

- Start scanning file system objects including boot records
- Start updating virus databases
- View and change parameters of **Anti-virus** configuration
- View status of **Dr.Web for Linux** components and statistics on detected threats
- View quarantine and manage quarantined objects
- Connect to the central protection server or disconnect from it

User commands for **Anti-virus** management can have an effect only if **Anti-virus** service components are running (by default, they are automatically run on system startup).

Note that some control commands require superuser privileges.

To elevate privileges, use the **su** command (change the current user) or the **sudo** command (execute the specified command with other user privileges).

The **drweb-ctl** tool supports auto-completion of commands for managing **Anti-virus** operation if this option is enabled in the used command shell. If the command shell does not allow auto-completion, you can configure this option. For that purpose, refer to the instruction manual for the used OS distribution.

Call Format

1. Format of the utility call

The call format for the command-line tool which manages **Dr.Web for Linux** operation is as follows:

```
$ drweb-ctl [<general options> | <command> [<argument>] [<command options>]]
```

where:

- **<general options>** – options that can be applied on startup when the command is not specified or can be applied for any command. Not mandatory for startup.
- **<command>** – command to be performed by **Anti-virus** (for example, start scanning, output the list of quarantined objects).
- **<argument>** – command argument. Depends on the specified command. Can be missing for certain commands.
- **<command options>** – options managing command operation. Depends on the command. Can be missing for certain commands.

2. General options

The following general options are available:

Option	Description
-h, --help	Show summary help information and exit. For information on a certain command, enter the following: <code>drweb-ctl -h <command></code> or <code>drweb-ctl <command> -h</code>
-v, --version	Show information on the module version and exit
-d, --debug	Instructs to show debug information upon execution of the specified command. Has no effect if a command is not specified. To invoke a command, enter the following: <code>drweb-ctl -d <command></code>

3. Commands

Commands to manage **Anti-virus** can be divided into the following groups:

- Anti-virus scanning commands
- Commands to manage updates and operation in *Central protection mode*
- Configuration management commands
- Commands to manage detected threats and quarantine
- Information commands

3.1. Anti-virus scanning commands

The following commands to manage anti-virus scanning are available:

Command	Description
scan <path>	<p>Function</p> <p>Start checking the specified file or directory with Scanner.</p> <p>Arguments</p> <p><path> – Path to the file or directory which is selected to be scanned.</p> <p>This argument can be missing if the <code>--stdin</code> or <code>--stdin0</code> option is specified.</p> <p>To specify several files that satisfy a certain criterion, use the <code>find</code> utility (see the examples) and the <code>--stdin</code> or <code>--stdin0</code> options.</p> <p>Options</p> <p><code>-a</code> [<code>--Autonomous</code>] – Start a separate instance of Anti-virus engine and Scanner and terminate their operation after the scanning task completes. Note that threats detected during autonomous scanning are not displayed in the common threat list that is output by <code>threats</code> command (see below).</p> <p><code>--stdin</code> – Get list of paths to scan from the standard input string (stdin). Paths in the list must be separated by the new line character ('<code>\n</code>').</p> <p><code>--stdin0</code> – Get list of paths to scan from the standard input string (stdin). Paths in the list must be separated by the NUL character NUL ('<code>\0</code>').</p> <p>Note that templates are not allowed when specifying paths for either of these options.</p> <p>Recommended usage of the <code>--stdin</code> and <code>--stdin0</code> options is processing a path list (generated by an external utility, for example, <code>find</code>) in the <code>scan</code> command (see examples).</p> <p><code>--Report</code> <BRIEF DEBUG> – Specify the type of scanning results report.</p> <p>Possible values:</p> <ul style="list-style-type: none">• BRIEF – brief report.• DEBUG – detailed report. <p>Default value: BRIEF</p> <p><code>--ScanTimeout</code> <number> – Set the timeout value for scanning one file, in ms. If the value is set to 0, time to scan a file is not limited.</p> <p>Default value: 0</p> <p><code>--PackerMaxLevel</code> <number> – Set the maximum nesting level when scanning packed objects. If the value is set to 0, the nested objects are not checked.</p> <p>Default value: 8</p> <p><code>--ArchiveMaxLevel</code> <number> – Set the maximum level of nesting when scanning archives (zip, rar, etc.). If the value is set to 0, the nested objects are not checked.</p> <p>Default value: 8</p> <p><code>--MailMaxLevel</code> <number> – Set the maximum level of nesting when scanning email messages (pst, tbb, etc.). If the value is set to 0, the nested objects are not checked.</p> <p>Default value: 8</p> <p><code>--ContainerMaxLevel</code> <number> – Set the maximum level of nesting when scanning containers of other types (HTML and others). If the value is set to 0, the nested objects are not checked.</p>

Command	Description
	<p><u>Default values:</u> 8</p> <p>--MaxCompressionRatio <ratio> – Set the maximum compression ratio for scanned objects. The ratio must be at least equal to 2. <u>Default value:</u> 3000</p> <p>--HeuristicAnalysis <On Off> – Enable or disable <i>heuristics analysis</i>. <u>Default value:</u> On</p> <p>--OnKnownVirus <action> – Action applied to a threat detected using signature analysis. <u>Allowed values:</u> REPORT, CURE, QUARANTINE, DELETE. <u>Default value:</u> REPORT</p> <p>--OnIncurable <action> – Action applied on failure to cure a detected threat or if a threat is incurable. <u>Allowed values:</u> REPORT, QUARANTINE, DELETE. <u>Default value:</u> REPORT</p> <p>--OnSuspicious <action> – Action applied to a threat detected using heuristics analysis. <u>Allowed values:</u> REPORT, QUARANTINE, DELETE. <u>Default value:</u> REPORT</p> <p>--OnAdware <action> – Action applied to adware. <u>Allowed values:</u> REPORT, QUARANTINE, DELETE. <u>Default values:</u> REPORT</p> <p>--OnDialers <action> – Action applied to a dialer. <u>Allowed values:</u> REPORT, QUARANTINE, DELETE. <u>Default values:</u> REPORT</p> <p>--OnJokes <action> – Action applied to a joke program. <u>Allowed values:</u> REPORT, QUARANTINE, DELETE. <u>Default values:</u> REPORT</p> <p>--OnRiskware <action> – Action applied to a potentially dangerous program (riskware). <u>Allowed values:</u> REPORT, QUARANTINE, DELETE. <u>Default values:</u> REPORT</p> <p>--OnHacktools <action> – Action applied to a hacktool. <u>Allowed values:</u> REPORT, QUARANTINE, DELETE. <u>Default values:</u> REPORT</p>
bootscan <disk drive> ALL	<p>Function</p> <p>Start checking boot records on the specified disks with Scanner. Both MBR and VBR records are scanned.</p> <p>Arguments</p> <p><disk drive> – Path to a block file of the disk device boot record of which is to be scanned. If you specify ALL, all boot records of all available disks are scanned. Mandatory argument.</p> <p>Options</p>

Command	Description
	<p>-a [--Autonomous] – Start a separate instance of the Anti-virus engine and Scanner and terminate their operation after the scanning task completes. Note that threats detected during autonomous scanning are not displayed in the common threat list that is output by <code>threats</code> command (see below).</p> <p>--Report <BRIEF DEBUG> – Specify the type of scanning results report.</p> <p><u>Possible values:</u></p> <ul style="list-style-type: none">• BRIEF – brief report.• DEBUG – detailed report. <p><u>Default value:</u> BRIEF</p> <p>--ScanTimeout <number> – Specify timeout to scan one file, in ms.</p> <p>If the value is set to 0, time to scan one file is not limited.</p> <p><u>Default value:</u> 0</p> <p>--HeuristicAnalysis <On Off> – Enable or disable <i>heuristics analysis</i>.</p> <p><u>Default value:</u> On</p> <p>--Cure <Yes No> – Enable or disable attempts to cure detected threats.</p> <p>If the value is set to no, only notification is output.</p> <p><u>Default value:</u> No</p> <p>--ShellTrace – Enable output of additional debug information when scanning a boot record.</p>
proscan	<p>Function</p> <p>Start checking executable files containing code of currently running processes with Scanner.</p> <p>Arguments</p> <p>No.</p> <p>Options</p> <p>-a [--Autonomous] – start a separate instance of the Anti-virus engine and Scanner and terminate their operation after the scanning task completes. Note that threats detected during autonomous scanning are not displayed in the common threat list that is output by <code>threats</code> command (see below).</p> <p>--Report <BRIEF DEBUG> – specify the type of scanning report.</p> <p><u>Allowed values:</u></p> <ul style="list-style-type: none">• BRIEF – brief report.• DEBUG – detailed report. <p><u>Default value:</u> BRIEF</p> <p>--ScanTimeout <number> – Specify timeout to scan one file, in ms.</p> <p>If the value is set to 0, time to scan one file is not limited.</p> <p><u>Default value:</u> 0</p> <p>--HeuristicAnalysis <On Off> – Enable or disable <i>heuristics analysis</i>.</p> <p><u>Default value:</u> On</p> <p>--PackerMaxLevel <number> – Set the maximum nesting level when scanning packed objects.</p> <p>If the value is set to 0, the nested objects are not checked .</p> <p><u>Default value:</u> 8</p>

Command	Description
	<p>--OnKnownVirus <action> – Action applied to a threat detected using signature analysis.</p> <p><u>Allowed values:</u> REPORT, CURE, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>--OnIncurable <action> – Action applied on failure to cure a detected threat or if a threat is incurable.</p> <p><u>Allowed values:</u> REPORT, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>--OnSuspicious <action> – Action applied to a threat detected using heuristics analysis.</p> <p><u>Allowed values:</u> REPORT, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>--OnAdware <action> – Action applied to adware.</p> <p><u>Allowed values:</u> REPORT, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>--OnDialers <action> – Action applied to dialers.</p> <p><u>Allowed values:</u> REPORT, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>--OnJokes <action> – Action applied to joke programs.</p> <p><u>Allowed values:</u> REPORT, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>--OnRiskware <action> – Action applied to potentially dangerous programs (riskware).</p> <p><u>Allowed values:</u> REPORT, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>--OnHacktools <action> – Action applied to hacktools.</p> <p><u>Allowed values:</u> REPORT, QUARANTINE, DELETE.</p> <p><u>Default value:</u> REPORT</p> <p>Note that if a threat is detected in an executable file, Anti-virus terminates all processes started from the file.</p>

3.2. Commands to manage updates and operation in Central protection mode

The following commands for managing updates and operation in Central protection mode are available:

Command	Description
update	<p>Function</p> <p>Instruct Updater to download and install updates to virus databases and components from Doctor Web update servers or terminate an updating process if running.</p> <p>The command has no effect if Anti-virus is connected to the central protection server.</p> <p>Arguments</p> <p>No.</p> <p>Options</p> <p>--Stop – Terminate the currently performed updating process.</p>
esconnect <server>[:port]	<p>Function</p>

Command	Description
	<p>Connect Dr.Web for Linux to the specified central protection server (for example, Dr.Web Enterprise Server). For details on Anti-virus operation modes, refer to Operation modes.</p> <p>Arguments</p> <ul style="list-style-type: none">• <server> – IP address or network name of the host on which the central protection server is operating. The argument is mandatory.• <port> – Name of the port used by the central protection server. The argument is optional. Specify the argument only if the central protection server uses a non-standard port. <p>Options</p> <p>--Key <path> – Path to the public key file of the central protection server to which Anti-virus is connected.</p> <p>--Login <ID> – Login (workstation identifier) used for connection to the central protection server.</p> <p>--Password <password> – Password for connection to the central protection server.</p> <p>--Group <ID> – identifier of the group to which the workstation is added on connection.</p> <p>--Rate <ID> – identifier of the tariff group applied to a workstation when it is included in one of the central protection server groups (can be specified only together with the --Group option).</p> <p>--Compress <On Off> – enables (On) or disables (Off) force compression of transmitted data. When not specified, usage of compression is determined by server.</p> <p>--Encrypt <On Off> – enables (On) or disables (Off) force encryption of transmitted data. When not specified, usage of encryption is determined by server.</p> <p>--Newbie – connect as a «newbie» (get a new account on the server).</p> <p>--WithoutKey – allows connection to the server without using the public key.</p> <p>--WrongKey – allows connection to the server even if the specified public key is wrong.</p> <p>The --Key and --WithoutKey options are mutually exclusive. One of these options must be specified in the command.</p> <p>Note that this command requires drweb-ct1 to be started with superuser privileges.</p>
esdisconnect	<p>Function</p> <p>Disconnect Dr.Web for Linux from the central protection server and switch its operation to autonomous mode.</p> <p>The command has no effect if Anti-virus is in autonomous mode.</p> <p>Arguments</p> <p>No.</p> <p>Options</p> <p>No.</p> <p>Note that this command requires drweb-ct1 to be started with superuser privileges.</p>

3.3. Configuration management commands

The following commands to manage configuration are available:

Command	Description
cfset	Function

Command	Description
<code><section>.<parameter> > <value></code>	<p>Change the active value of the specified parameter in the current configuration. Note that an equal sign is not allowed.</p> <p>Arguments</p> <ul style="list-style-type: none">• <code><section></code> – Name of the configuration file where the parameter resides. The argument is mandatory.• <code><parameter></code> – Name of the parameter. The argument is mandatory.• <code><value></code> – New value that is to be assigned to the parameter. The argument is mandatory. <p>The following format is used to specify the parameter value <code><section>.<parameter> <value></code></p> <p>For description of the configuration file, refer to the man documentation <code>drweb.ini(5)</code>.</p> <p>Options</p> <p><code>-a [--Add]</code> – Do not substitute the current parameter value but add the specified value to the list (allowed only for parameters that can have several values, specified as a list).</p> <p><code>-e [--Erase]</code> – Do not substitute the current parameter value but remove the specified value from the list (allowed only for parameters that can have several values, specified as a list).</p> <p><code>-r [--Reset]</code> – Reset the parameter value to the default. At that, <code><value></code> is not required in the command and is ignored if specified.</p> <p>Options are not mandatory. If they are not specified, the current parameter value (or the list of ones if several values are specified) are substituted with the specified value.</p> <p>For the <code>-r</code> option, a special syntax to invoke the <code>cfset</code> command is used: cfset <code><section>.* -r</code></p> <p>In this case, all parameters of the specified section are reset to defaults.</p> <p>Note that this command requires <code>drweb-ctl</code> to be started with superuser privileges.</p>
cfshow <code>[<section> [.<parameter>]</code>	<p>Function</p> <p>Output parameters of the current configuration.</p> <p>The command to output parameters is specified as follows <code><section>.<parameter> = <value></code>. Sections and parameters of non-installed components are not output.</p> <p>Arguments</p> <ul style="list-style-type: none">• <code><section></code> – Name of the configuration file section parameters of which are to be output. The argument is optional. If not specified, parameters of all configuration file sections are output.• <code><parameters></code> – Name of the output parameter. The argument is optional. If not specified, all parameters of the section are output. Otherwise, only this parameter is output. If a parameter is specified without the section name, all parameters with this name from all of the configuration file sections are output. <p>Options</p> <p><code>--Uncut</code> – Output all configuration parameters (not only those used with the currently installed set of components). If the option is not specified, only parameters used for configuration of the installed components are output.</p> <p><code>--Ini</code> – Output parameter values in the INI file format: at first, the section name is specified in square brackets, then the section parameters listed as <code><parameter> = <value></code> pairs (one pair per line).</p>

3.4. Commands to manage detected threats and quarantine

The following commands for managing threats and quarantine are available:

Command	Description
threats [<command> <object>]	<p>Function</p> <p>Apply the specified action to detected threats by their identifiers. Type of the action is configured with the specified command option.</p> <p>If the action is not specified, output information on detected but not neutralized threats.</p> <p>Arguments</p> <p>No.</p> <p>Options</p> <p>-f [--Follow] – Wait for new messages on new threats and output the messages once they are received (interrupt waiting with ^C).</p> <p>--Cure <threat list> – Attempt to cure the listed threats (threat identifiers are specified as a comma-separated list).</p> <p>--Quarantine <threat list> – Move the listed threats to quarantine (threat identifiers are specified as a comma-separated list)</p> <p>--Delete <threat list> – Delete the listed threats (threat identifiers are specified as a comma-separated list).</p> <p>--Ignore <threat list> – Ignore the listed threats (threat identifiers are specified as a comma-separated list).</p> <p>If it is required to apply the command to all detected threats, specify <code>all</code> instead of <threat list>.</p> <p>For example, the following command</p> <pre>drweb-ctl threats --Quarantine all</pre> <p>moves all detected malicious objects to quarantine.</p>
quarantine [<command> <object>]	<p>Function</p> <p>Apply an action to the specified object in quarantine.</p> <p>If not specified, the following information is output: object identifier in quarantine and brief information on source files.</p> <p>Arguments</p> <p>No.</p> <p>Options</p> <p>--Delete <object> – Delete the specified object from quarantine.</p> <p>Note that objects are deleted from quarantine permanently.</p> <p>--Restore <object> – Restore the specified object from quarantine to the original location.</p> <p>As an <object> specify the object identifier in quarantine. To apply the command to all quarantined objects, specify <code>all</code> as an <object>.</p> <p>For example, the following command</p> <pre>drweb-ctl quarantine --Restore all</pre> <p>restores all objects from quarantine.</p>

3.5. Information Commands

The following information commands are available:

Command	Description
appinfo	<p>Function</p> <p>Output information on active Anti-virus modules.</p>

Command	Description
	<p><u>Arguments</u></p> <p>No.</p> <p><u>Options</u></p> <p>-f [--Follow] – Wait for new messages on module status change and output them once such a message is received (interrupt waiting with ^C).</p>
baseinfo	<p><u>Function</u></p> <p>Output information on the current version of the Anti-virus engine and status of virus databases.</p> <p><u>Arguments</u></p> <p>No.</p> <p><u>Options</u></p> <p>No.</p>
license	<p><u>Function</u></p> <p>Output information on the active license.</p> <p><u>Arguments</u></p> <p>No.</p> <p><u>Options</u></p> <p>No.</p>

Example Usage

Example usage of the `drweb-ctl` command:

- 1) Start scanning of the `/home` directory with default parameters:

```
$ drweb-ctl scan /home
```

- 2) Scan paths listed in the `daily_scan` file (one path per line):

```
$ drweb-ctl scan --stdin < daily_scan
```

- 3) Start scanning the boot record on the `sda` disk:

```
$ drweb-ctl bootscan /dev/sda
```

- 4) Output all parameters from the `[Root]` section of the active configuration:

```
$ drweb-ctl cfshow Root
```

- 5) Set 'No' as the `start` parameter value in the `[LinuxSpider]` section (this parameter value disables **SpIDer Guard** — monitor of the file system in **Linux OS**):

```
# drweb-ctl cfset LinuxSpider.Start No
```

Note that superuser privileges are required to perform this action. To elevate the privileges, you can use the `sudo` command, as shown in the following example:

```
$ sudo drweb-ctl cfset LinuxSpider.Start No
```

Example usage of the `find` utility to select files for scanning (the `drweb-ctl scan --stdin` command):

- 1) Scan all files in all directories, starting from the root directory, on the same partition of the file system:

```
$ find / -xdev -type f | drweb-ctl scan --stdin
```

- 2) Scan all files in all directories, starting from the root directory, except files residing in the `/var/log/messages` and `/var/log/syslog` directories:

```
$ find / -type f ! -path /var/log/messages ! -path /var/log/syslog | drweb-ctl scan --stdin
```

- 3) Scan all files of the `root` user in all directories, starting from the root directory:

```
$ find / -type f -user root | drweb-ctl scan --stdin
```

- 4) Scan files of the `root` and `admin` users in all directories, starting from the root directory:

```
$ find / -type f \( -user root -o -user admin \) | drweb-ctl scan --stdin
```

- 5) Scan files of users with `UID` in the range `1000 - 1005` in all directories, starting from the root directory:

```
$ find / -type f -uid +999 -uid -1006 | drweb-ctl scan --stdin
```

- 6) Scan files in all directories, starting from the root directory, with a nesting level not more than five:

```
$ find / -maxdepth 5 -type f | drweb-ctl scan --stdin
```

- 7) Scan files in a root directory ignoring files in subdirectories:

```
$ find / -maxdepth 1 -type f | drweb-ctl scan --stdin
```

- 8) Scan files in all directories, starting from the root directory, with following all symbolic links:

```
$ find -L / -type f | drweb-ctl scan --stdin
```

- 9) Scan files in all directories, starting from the root directory, without following symbolic links:

```
$ find -P / -type f | drweb-ctl scan --stdin
```

- 10) Scan files created not later than July 3, 2013 in all directories, starting with the root directory:

```
$ find / -type f -newermt 2013-07-03 | drweb-ctl scan --stdin
```

Appendices

Appendix A. Types of Computer Threats

Herein, the term “*threat*” is defined as any kind of software potentially or directly capable of inflicting damage to a computer or network and compromising the user's information or rights (that is, malicious and other unwanted software). In a wider sense, the term “threat” may be used to indicate any type of potential danger to the security of the computer or network (that is, vulnerabilities that can result in hacker attacks).

All of the program types stated below have the ability to endanger the user's data or confidentiality. Programs that do not conceal their presence (e.g. spam distribution software and various traffic analyzers) are usually not considered as computer threats, although they can become threats under certain circumstances.

In **Doctor Web** classification, all threats are divided according to the level of severity into two types:

- **Major threats** – classic computer threats that may perform destructive and illegal actions in the system on their own (erase or steal important data, crash networks, etc.). This type of computer threats consists of software that is traditionally referred to as malware (malicious software), that is, viruses, worms and Trojans.
- **Minor threats** – computer threats that are less dangerous than major threats, but may be used by a third person to perform malicious activity. Also, mere presence of minor threats in the system indicates its low protection level. Among IT security specialists this type of computer threats is sometimes referred to as grayware or PUP (potentially unwanted programs) and consists of the following program types: adware, dialers, jokes, riskware, hacktools.

Major threats

Computer Viruses

This type of computer threats is characterized by the ability to implement its code into other objects. Such implementation is called infection. In most cases, the infected file becomes a virus carrier itself and the implemented code does not necessarily match the original. Most viruses are intended to damage or destroy data in the system.

In **Doctor Web** classification, viruses are divided by the type of objects which they infect:

- **File viruses** infect files of the operating system (usually executable files and dynamic libraries) and activate upon launching of the infected file.
- **Macro-viruses** are viruses that infect documents used by Microsoft® Office and some other applications supporting macro commands (usually, written in Visual Basic). Macro commands are a type of implemented programs (macros) written in a fully functional programming language. For instance, in Microsoft® Word macros can automatically initiate upon opening (closing, saving, etc.) a document.
- **Script viruses** are created using script languages and usually infect other scripts (e.g. service files of an operating system). They are also able to infect other file formats that allow execution of scripts and thus take advantage of scripting vulnerabilities in web applications.
- **Boot viruses** infect boot records of diskettes and partitions or master boot records of fixed disks. They require very little memory and remain ready to continue performing their tasks until a system roll-out, restart or shut-down occurs.

Most viruses have some kind of protection against detection. Protection methods are being constantly improved and ways to overcome them are constantly being developed. All viruses may also be classified according to the type of protection that they use:

- **Encrypted viruses** cipher their code upon every infection to hamper their detection in a file, boot sector or memory. All copies of such viruses contain only a small common code fragment (the decryption procedure) that can be used as a virus signature.
- **Polymorphic viruses** also encrypt their code, but besides that they also generate a special decryption procedure that is different in every copy of the virus. This means that such viruses do not have byte signatures.
- **Stealth viruses** perform certain actions to disguise their activity and thus conceal their presence in an infected object. Such viruses gather the characteristics of an object before infecting it and then plant these “dummy” characteristics that mislead the scanner searching for modified files.

Viruses can also be classified according to the programming language in which they are written (in most cases, it is Assembler, high-level programming languages, script languages, etc.) or according to affected operating systems.

Computer Worms

Worms have become a lot more widespread than viruses and other types of computer threats recently. Like viruses, they are able to reproduce themselves and spread their copies, but they do not infect other programs and files (that is, they do not need host files to spread). A worm infiltrates a computer from a worldwide or local network (usually via an attachment to an email) and distributes its functional copies to other computers in the network. It can begin distributing itself either upon a user's action or in an automatic mode choosing which computers to attack.

Worms do not necessarily consist of only one file (the worm's body). Many of them have an infectious part (the shellcode) that loads into the main memory (RAM) and then downloads the worm's body as an executable file via the network. If only the shellcode is present in the system, the worm can be deleted by simply restarting the system (at which the RAM is erased and reset). However, if the worm's body infiltrates the computer, then only an anti-virus program can cope with it.

Worms have the ability to cripple entire networks even if they do not bear any payload (i.e. do not cause any direct damage) due to their intensive distribution.

In **Doctor Web** classification, worms are divided by the method of distribution:

- Net worms distribute their copies via various network and file-sharing protocols.
- Mail worms spread themselves using email protocols (POP3, SMTP, etc.).
- Chat worms use protocols of popular messengers and chat programs (ICQ, IM, IRC, etc.).

Trojan Programs (Trojans)

This type of computer threats cannot reproduce itself or infect other programs. A Trojan substitutes a program that is used a lot and performs its functions (or imitates its operation). At the same time, it performs some malicious actions in the system (damages or deletes data, sends confidential information, etc.) or makes it possible for hacker to access the computer without permission, for example, to harm the computer of a third party.

A Trojan's masking and malicious facilities are similar to those of a virus. A Trojan may even be a component of a virus. However, most Trojans are distributed as separate executable files (through file-exchange servers, removable data carriers or email attachments) that are launched by users or system tasks.

It is very hard to classify Trojans due to the fact that they are often distributed by viruses or worms and also because many malicious actions that can be performed by other types of threats are ascribed to Trojans only. Here are some Trojan types which are distinguished as separate classes in **Doctor Web**:

- **Backdoors** are Trojans that make it possible for an intruder to log on into the system or obtain privileged functions bypassing any existing access and security measures. Backdoors do not infect files, but they write themselves into the registry modifying the registry keys.
- **Rootkits** are used to intercept system functions of an operating system in order to conceal themselves. Besides, a rootkit can conceal processes of other programs (e.g. other threats), registry keys, folders and files. It can be distributed either as an independent program or as a component of another malicious program. There are two kinds of rootkits according to the mode of operation: User Mode Rootkits (UMR) that operate in user mode (intercept functions of the user mode libraries) and Kernel Mode Rootkits (KMR) that operate in kernel mode (intercept functions on the level of the system kernel, which makes it harder to detect).
- **Keyloggers** are used to log data that users enter by means of a keyboard. The aim of this is to steal personal information (i.e. network passwords, logins, credit card data, etc.).
- **Clickers** redirect hyperlinks to certain addresses in order to increase traffic of websites or perform DDoS attacks.
- **Proxy Trojans** provide anonymous Internet access through a victim's computer.

Trojans may also perform other malicious actions besides those stated above, for example, change the start page in a web browser or delete certain files. However, other actions can also be performed by other types of threats (viruses and worms).

Minor Threats

Hacktools

Hacktools are programs designed to assist the intruder with hacking. The most common among them are port scanners that detect vulnerabilities in firewalls and other components of computer protection system. Besides hackers, such tools are used by administrators to check security of their networks. Occasionally, common software that can be used for hacking and various programs that use social engineering techniques are designated as among hacktools as well.

Adware

Usually, this term refers to a program code implemented into freeware programs that force display of advertisements to users. However, sometimes such codes can be distributed via other malicious programs and show advertisements in web browsers. Many adware programs operate with data collected by spyware.

Jokes

Like adware, this type of minor threats can not be used to inflict any direct damage to the system. Joke programs usually just generate messages about errors that never occurred and threaten to perform actions that will lead to data loss. Their purpose is to frighten or annoy users.

Dialers

These are special programs that are designed to scan a range of telephone numbers and find those where a modem answers. These numbers are then used to mark up the price of telephoning facilities or to connect the user to expensive telephone services.

Riskware

These programs were not intended as computer threats, but can potentially cripple or be used to cripple system security due to certain features and, therefore, are classified as minor threats. Riskware programs are not only those that can accidentally damage or delete data, but also ones that can be used by crackers or some malicious programs to do harm to the system. Among such programs are various remote chat and administrative tools, FTP-servers, etc.

Suspicious Objects

These are possible computer threats detected by the heuristic analyzer. Such objects can potentially be any type of threat (even unknown to IT security specialists) or turn out safe in case of a false detection.

Suspicious objects should be sent for analysis to the **Doctor Web Virus Laboratory**.

Appendix B. Fighting Computer Threats

The **Dr.Web Anti-virus solutions** use several malicious software detection methods simultaneously, and that allows them to perform thorough checks on suspicious files and control software behavior.

Detection Methods

Signature analysis

The scans begin with *signature analysis* which is performed by comparison of file code segments to the known virus signatures. A *signature* is a finite continuous sequence of bytes which is necessary and sufficient to identify a specific virus. To reduce the size of the signature dictionary, the **Dr.Web Anti-virus solutions** use signature checksums instead of complete signature sequences. Checksums uniquely identify signatures, which preserves correctness of virus detection and neutralization. The **Dr.Web virus databases** are composed so that some entries can be used to detect not just specific viruses, but whole classes of threats.

Origins Tracing

On completion of signature analysis, the **Dr.Web Anti-virus solutions** use the unique **Origins Tracing™** method to detect new and modified viruses which use the known infection mechanisms. Thus, **Dr.Web** users are protected against such threats as notorious blackmailer **Trojan.Encoder.18** (also known as **gpcode**). In addition to detection of new and modified viruses, the **Origins Tracing™** mechanism allows to considerably reduce the number of false triggering of the heuristics analyzer. Objects detected using the **Origins Tracing™** algorithm are indicated with the `.Origin` extension added to their names.

Execution emulation

The technology of program code emulation is used for detection of polymorphic and encrypted viruses, when the search against checksums cannot be applied directly, or is very difficult to be performed (due to the impossibility of building secure signatures). The method implies simulating the execution of an analyzed code by an *emulator* – a programming model of the processor and runtime environment. The emulator operates with protected memory area (*emulation buffer*), in which execution of the analyzed program is modelled instruction by instruction. However, none of these instructions is actually executed by the CPU. When the emulator receives a file infected with a polymorphic virus, the result of the emulation is a decrypted virus body, which is then easily determined by searching against signature checksums.

Heuristic analysis

The detection method used by the heuristics analyzer is based on certain knowledge (*heuristics*) about certain features (attributes) than might be typical for the virus code itself, and vice versa, that are extremely rare in viruses. Each attribute has a weight coefficient which determines the level of its severity and reliability. The weight coefficient can be positive if the corresponding attribute is indicative of a malicious code or negative if the attribute is uncharacteristic of a computer threat. Depending on the sum weight of a file, the heuristics analyzer calculates the probability of unknown virus infection. If the threshold is exceeded, the heuristic analyzer generates the conclusion that the analyzed object is probably infected with an unknown virus.

The heuristics analyzer also uses the **FLY-CODE™** technology, which is a versatile algorithm for extracting files. The technology allows making heuristic assumptions about the presence of malicious objects in files compressed not only by packagers **Dr.Web** is aware of, but by also new, previously unexplored programs. While checking packed objects, **Dr.Web Anti-virus solutions** also use structural entropy analysis. The technology detects threats by arranging pieces of code; thus, one database entry allows identification of a substantial portion of threats packed with the same polymorphous packager.

As any system of hypothesis testing under uncertainty, the heuristics analyzer may commit type I or type II errors (omit viruses or raise false alarms). Thus, objects detected by the heuristics analyzer are

treated as "suspicious".

While performing any of the abovementioned checks, the **Dr.Web Anti-virus solutions** use the most recent information about known malicious software. As soon as experts of **Doctor Web Virus Laboratory** discover new threats, the update for virus signatures, behavior characteristics and attributes is issued. In some cases updates can be issued several times per hour. Therefore even if a brand new virus passes through the **Dr.Web** resident guards and penetrates the system, then after an update the virus is detected in the list of processes and neutralized.

Actions

To avert computer threats, **Dr.Web** products use a number of actions that can be applied to malicious objects. A user can leave the default settings, configure which actions to apply automatically, or choose actions manually upon every detection. Below is a list of possible actions:

- **Cure** is an action that can only be applied to major threats (viruses, worms and Trojans). It implies deletion of malicious code from infected objects as well as recovery of their structure and operability to the state in which it was before the infection if possible. Sometimes malicious objects are made of malicious code only (for example, Trojans or functional copies of computer worms) and for such objects to cure the system means to remove the whole object completely. Not all files infected by viruses can be cured, but curing algorithms evolve all the time.
- **Quarantine (Move to Quarantine)** is an action when the detected threat is moved to a special directory and isolated from the rest of the system. This action is preferable in cases when curing is impossible and for all suspicious objects. It is recommended to send copies of such files to the **Doctor Web Virus Laboratory** for analysis.
- **Delete** is the most effective action for averting computer threats. It can be applied to any type of computer threat. Note that deletion will sometimes be applied to certain objects for which the Cure action was selected. This will happen in cases if the object consists of only malicious code and have no useful information (for example, curing a computer worm implies deletion of all its functional copies).
- **Ignore** is an action applicable to minor threats only (that is, adware, dialers, jokes, hacktools and riskware) that instructs to skip the threat without performing any action or displaying information in report.
- **Report** means that no action is applied to the object and the threat is only listed in results report.

Appendix C. Contacting Support

If you encounter any issues installing or using company products, take advantage of the following **Doctor Web** support options:

- Download and review the latest manuals and guides at <http://download.drweb.com/>
- Read the frequently asked questions at <http://support.drweb.com/>
- Browse **Dr.Web Official Forum** at <http://forum.drweb.com/>

If you have not found solution for the problem, you can request direct assistance from **Doctor Web Technical Support** by filling in the web form in the corresponding section of the support site at <http://support.drweb.com/>.

For regional office information, visit the **official Doctor Web website** at <http://company.drweb.com/contacts/moscow>.

Appendix D. Known Errors

If you cannot find description of the occurred error, it is recommended to contact [technical support](#). Be ready to name the error code and describe steps to reproduce the issue.

Errors, determined by code

Error message: *Feature not implemented.*

Error code: x65

Description: One of **Dr.Web for Linux** components cannot be in operation as it is requested to perform a function which is not implemented in the current version.

Resolving the error:

SpIDer Gate: an attempt to enable check of incoming connections.

- Execute the command

```
# drweb-ctl cfset GateD.InputDivert Off
```

to disable check of incoming connections by **SpIDer Gate**.

Other components:

- Restore software defaults. For that purpose
 1. Clear contents of the file `/etc/opt/drweb.com/drweb.ini`. It is recommended to back up the file before the procedure. For example:

```
# cp /etc/opt/drweb.com/drweb.ini /etc/opt/drweb.com/drweb.ini.save  
# echo "" > /etc/opt/drweb.com/drweb.ini
```

2. Execute the command

```
# service drweb-configd restart
```

to restart **Dr.Web for Linux**.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Invalid DRL file.*

Error code: x90

Description: Updating cannot be performed as **Updater** detected integrity violation or cannot find a signed file with the list of update servers.

Resolving the error:

- Install `drweb-bases` and `drweb-dws` components (packages) separately and then start an update.
- If the error persists, remove **Dr.Web for Linux** and then install it again on the system and restart the update.
- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Invalid compressed file.*

Error code: x92

Description: **Updater** detected integrity violation or cannot find the archive file received from the update server.

Resolving the error:

- Restart the update after some time.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Proxy authentication error.*

Error code: x93

Description: **Updater** failed to connect to an update server as was not authenticated on the proxy server used for receiving updates.

Resolving the error:

- Check and correct [parameters](#) of the used proxy server (username and password used for authentication).
- If an error persists, change the proxy server or do not use proxy for connections.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *No update servers available.*

Error code: x94

Description: **Updater** cannot connect to any of the update servers.

Resolving the error:

- Check whether the network connection is established and verify the connectivity. Ensure that your computer is connected to the Internet.
- If Internet connection is allowed only via proxy, [configure](#) the use of proxy for receiving updates.
- If a proxy server is used, check and adjust the used connection [parameters](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *File format is unknown or unsupported.*

Error code: x95

Description: Updates cannot be received as [key file](#) integrity is violated.

Resolving the error:

- [Install](#) the key file from the backup. If you cannot find the backup, contact [technical support](#) to obtain it.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *License is already expired.*

Error code: x96

Description: Updates cannot be received as the used license is expired.

Resolving the error:

- Purchase a new [license](#) and activate the product via [License Manager](#).

If you are sure that the licensed period is not expired, contact [technical support](#) and be ready to name the error code.

Error message: *Network operation timed out.*

Error code: x97

Description: **Updater** cannot receive the updates because connection was lost.

Resolving the error:

- Check whether the network connection is established and verify the connectivity. Ensure that your computer is connected to the Internet.
- If a proxy server is used, check and adjust the used connection [parameters](#).
- If an error persists, change the proxy server or do not use proxy for connections.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Invalid checksum.*

Error code: x98

Description: A file with updates received by **Updater** has a checksum that is not equal to expected.

Resolving the error:

- Restart the update after some time.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Invalid demo key file.*

Error code: x99

Description: Updates cannot be received as demo [key file](#) integrity is violated or its use is not authorised.

Resolving the error:

- Purchase a [license](#) and activate the product via [License Manager](#).

If you are sure that the demo key file is valid, contact [technical support](#) and be ready to name the error code.

Error message: *Blocked license key.*

Error code: x100

Description: Updates cannot be received as the used [key file](#) is blocked by **Doctor Web**.

Resolving the error:

- Purchase a [license](#) and activate the product via [License Manager](#).

If you are sure that the used key file is valid, contact [technical support](#) and be ready to name the error code.

Error message: *Invalid configuration.*

Error code: x102

Description: One of **Dr.Web for Linux** components cannot be in operation due to incorrect configuration settings.

Resolving the error:

SpIDer Guard: the specified operation mode is not supported by the operating system.

- Execute the command

```
# drweb-ctl cfset LinuxSpider.Mode AUTO
```

to switch the operation of **SpIDer Guard** to automatic mode.

- If the error persists, [manually build and install](#) the loadable kernel module to be used by **SpIDer Guard**.

Note that operation of **SpIDer Guard** and of the loadable kernel module is guaranteed only on the tested **Linux** distributives (see [System Requirements](#)).

Other components:

- Restore software defaults. For that purpose
 3. Clear contents of the file `/etc/opt/drweb.com/drweb.ini`. It is recommended to back up the file before the procedure. For example:

```
# cp /etc/opt/drweb.com/drweb.ini /etc/opt/drweb.com/drweb.ini.save  
# echo "" > /etc/opt/drweb.com/drweb.ini
```

4. Execute the command

```
# service drweb-configd restart
```

to restart **Dr.Web for Linux**.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Invalid executable file.*

Error code: x104

Description: An executable file of one of **Dr.Web for Linux** components unavailable or corrupted.

Resolving the error:

- Install the package with the necessary component:
 - `drweb-spider`, if the executable file of **SpIDer Guard** is invalid
 - `drweb-gated`, if the executable file of **SpIDer Gate** is invalid
 - `drweb-update`, if the executable file of **Updater** is invalid
- If the error persists, or you cannot detect which executable file is invalid, remove **Dr.Web for Linux** and then install it again on the system.

- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Invalid core engine file.*

Error code: x105

Description: **Dr.Web for Linux** cannot operate because executable file of anti-virus engine **Dr.Web Virus-Finding Engine** is unavailable or corrupted.

Resolving the error:

- [Update](#) virus databases.
- If the error persists, install the `drweb-bases` package containing virus databases and anti-virus engine executable file.
- If the error still occurs, remove **Dr.Web for Linux** and then install it again on the system.
- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *No virus databases.*

Error code: x106

Description: **Dr.Web for Linux** cannot protect your computer because virus databases are unavailable or corrupted.

Resolving the error:

- [Update](#) virus databases.
- If the error persists, install the `drweb-bases` package containing virus databases and anti-virus engine executable file.
- If the error still occurs, remove **Dr.Web for Linux** and then install it again on the system.
- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Incompatible software detected.*

Error code: x109

Description: One of **Dr.Web for Linux** components cannot be in operation as an incompatible software is detected.

Resolving the error:

SpIDer Gate: software detected which generates rules for the system firewall are incompatible with **SpIDer Gate** operation.

- Disable or reconfigure the software so as to prevent any interference in **SpIDer Gate** operation.
- On **OpenSuse Linux** OS with default settings, conflicts between **SpIDer Gate** and system firewall **SuseFirewall2** can occur. To remove the conflict, change the settings of the system firewall **SuseFirewall2**. For that purpose:

1. Open the configuration file of **SuseFirewall2** (by default, this is the `/etc/sysconfig/SuSEfirewall2` file).
2. Find the following text block:

```
## Type: yesno
#
# Install NOTRACK target for interface lo in the raw table. Doing so
# speeds up packet processing on the loopback interface. This breaks
# certain firewall setups that need to e.g. redirect outgoing
# packets via custom rules on the local machine.
#
# Defaults to "yes" if not set
#
FW_LO_NOTRACK=""
```

3. Set the parameter value to "no" :

```
FW_LO_NOTRACK="no"
```

4. Restart **SuseFirewall2**. To do it, use the following command:

```
# rcSuSEfirewall2 restart
```

5. Restart **SpIDer Gate** (disable and then enable it on the corresponding [page](#)).

Note that **OpenSuse Linux** OS is not included in the list of tested **Linux** distributions, on which **Anti-virus** operation is guaranteed (see "System Requirements"[System Requirements](#)).

Other components:

- Disable or reconfigure the software so as to prevent any interference in **Dr.Web for Linux** operation.

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *ScanEngine is not available.*

Error code: x119

Description: Cannot check files as **drweb-se** module is missing or failed to start. This module is used for searching malicious objects.

Failed to start: **Scanner**, **SpIDer Guard**, **SpIDer Gate** (partially).

Resolving the error:

- If you use 64-bit version of the operating system, make sure that 32-bit application support libraries are installed (see [System Requirements](#)) and, if necessary, install them.
- If your operating system uses **SELinux**, configure the security policy for **drweb-se** module (see [Adjusting SELinux Policies](#)).

- Execute the command

```
# drweb-ctl cfshow ScanEngine.ExePath
```

If the output string differs from `ScanEngine.ExePath = /opt/drweb.com/bin/drweb-se`, execute the following command:

```
# drweb-ctl cfset ScanEngine.ExePath /opt/drweb.com/bin/drweb-se
```

- If the error persists, install **drweb-se** component (package) separately.
- If the error still occurs, remove **Dr.Web for Linux** and then install it again on the system.

- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *FileCheck is not available.*

Error code: x120

Description: Cannot check files as a **Scanner** component **drweb-filecheck**, used for this function, is missing.

Failed to start: **Scanner, SpIDer Guard.**

Resolving the error:

- If you use 64-bit version of the operating system, make sure that 32-bit application support libraries are installed (see [System Requirements](#)) and, if necessary, install them.
- If your operating system uses **SELinux**, configure the security policy for **drweb-filecheck** module (see [Adjusting SELinux Policies](#)).
- Execute the command

```
# drweb-ctl cfshow FileCheck.ExePath
```

If the output string differs from `FileCheck.ExePath = /opt/drweb.com/bin/drweb-filecheck`, execute the following command:

```
# drweb-ctl cfset FileCheck.ExePath /opt/drweb.com/bin/drweb-filecheck
```

- If the error persists, install **drweb-filecheck** component (package) separately.
- If the error still occurs, remove **Dr.Web for Linux** and then install it again on the system.
- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *Firewall is not available.*

Error code: x122

Description: Cannot control Internet access as **drweb-firewall** is missing or failed to start. The module is used for diverting of connections.

Failed to start: **SpIDer Gate.**

Resolving the error:

- Execute the command

```
# drweb-ctl cfshow Firewall.ExePath
```

If the output string differs from `Firewall.ExePath = /opt/drweb.com/bin/drweb-firewall`, execute the following command:

```
# drweb-ctl cfset Firewall.ExePath /opt/drweb.com/bin/drweb-firewall
```

- If an error persists, install **drweb-firewall** component (package) separately.
- If the error still occurs, remove **Dr.Web for Linux** and then install it again on the system.

- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Error message: *NetCheck is not available.*

Error code: x123

Description: Cannot control Internet access as **drweb-netcheck** is missing or failed to start. The module is used for check of downloaded files.

Failed to start: **SpIDer Gate** (partially).

Resolving the error:

- Execute the command

```
# drweb-ctl cfshow NetCheck.ExePath
```

If the output string differs from `NetCheck.ExePath = /opt/drweb.com/bin/drweb-netcheck`, execute the following command:

```
# drweb-ctl cfset NetCheck.ExePath /opt/drweb.com/bin/drweb-netcheck
```

- If the error persists, install **drweb-netcheck** component (package) separately.
- If the error still occurs, remove **Dr.Web for Linux** and then install it again on the system.
- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#) and be ready to name the error code.

Errors without error codes

Symptoms:

Main window of **Anti-virus** is disabled and displays the message *Dr.Web for Linux is loading...* or [state indicator](#) in notification area of desktop displays an critical error mark, and drop-down menu contains only one disabled item **Loading...**

Description:

Anti-virus cannot start because core component **drweb-configd** is not available.

Resolving the error:

- Execute the command

```
# service drweb-configd restart
```

to restart **Dr.Web for Linux**.

- If this command returns error message, or has no any effect, install **drweb-configd** component (package) separately.
- If the error still occurs, remove **Dr.Web for Linux** and then install it again on the system.
- For details on how to install and remove the product or product components, refer to the [Installation Procedure](#) and [Removing Dr.Web for Linux](#).

If the error persists, contact [technical support](#).

Appendix E. Building Kernel Module for SpIDer Guard

If the operating system does not support the `fanotify` monitoring interface, **SpIDer Guard** uses a special loadable module operating in kernel space.

By default, **SpIDer Guard** is supplied with a completely built loadable kernel module for the **CentOS** and **Red Hat Enterprise Linux** OSes, version 5.10 and 6.5, as these systems do not support `fanotify`. Moreover, you can build a loadable kernel module manually using the source codes supplied in a `tar.bz2` archive.

The loadable kernel module, used by **SpIDer Guard**, is intended for operation with **Linux** kernels 2.6 and newer.

The archive with source codes is located in the `share/drweb-spider-kmod/src` subdirectory of the **Dr.Web for Linux** base directory (by default, `/opt/drweb.com`). The archive's name is as follows: `drweb-spider-kmod-<version>-<date>.tar.bz2`.

The `drweb-spider-kmod` directory also contains the `check-kmod-install.sh` test script. Run the script to check whether the used OS supports kernel module versions included in the product. If not, a message prompting to manually build the module displays on the screen.

To build the loadable kernel module manually from the source codes, administrative (root) privileges are required. For that purpose, you can use the `su` command to switch to another user or the `sudo` command to build the module as a different user.

To build kernel module

1. Unpack the archive with source codes to any directory. For example, the command

```
# tar -xf drweb-spider-kmod-<version>-<date>.tar.bz2
```

unpacks the source codes to the created directory. This directory has the archive's name and is created in the same location where the archive resides.

2. Go to the created directory and execute the following command:

```
# make
```

If an error occurs during `make` command execution, resolve the issue (see [below](#)) and restart compilation.

3. After successful command execution, enter the following commands:

```
# make install
# depmod
```

4. After the kernel module is successfully compiled and registered on the system, perform additional configuration of **SpIDer Guard**. Set the component to operate with the kernel module by executing the following command:

```
# drweb-ctl cfset LinuxSpider.Mode LKM
```

You can also specify `AUTO` instead of `LKM`. In the latter case, **SpIDer Guard** will attempt to use kernel module and the monitoring interface `fanotify`. For more details, use the following command:

```
$ man drweb-spider
```

Possible build errors

While the **make** command is being executed, errors may occur. If so, check the following:

- To ensure successful building of the module, **Perl** and **GCC** are required. If they are missing on the system, install them.
- On certain OSes, you may need to install the **kernel-devel** package before starting the procedure.
- On certain OSes, the procedure can fail because the path to the directory with source codes was incorrectly defined. If so, specify the **make** command with the `KDIR=/path/to/kernel/source/codes` parameter. Typically, the source codes are located in the `/usr/src/kernels/<kernel_version>` directory. Note that the kernel version returned by the **uname -r** command can differ from the directory name `<kernel_version>`!
